

Metaprogramming in SML: PostFix and S-expressions

CS251 Programming Languages
Fall 2016, Lyn Turbak

Department of Computer Science
Wellesley College

Our Goal is Something Similar in SML

```
- testRun' "(postfix 2 1 nget mul swap 1 nget mul add) " "(3 4)";
val it = "25" : string

- val pf1String = "(postfix 2 2 nget 0 gt (sub) (swap 1 nget mul add)
sel exec)";
val pf1String = "(postfix 2 2 nget 0 gt (sub) (swap 1 nget mul add)
sel exec)" : string

- map (testRun' pf1String) ["(3 5)", "(3 -5)"];
val it = ["2","28"] : string list
```

Along the way we will see:

- Representing PostFix programs with sum-of-product datatypes
- Leveraging pattern matching in the PostFix interpreter
- Converting between string and sum-of-product representations of a Racket-like S-expression datatype.

Recall the Racket PostFix Interpreter

```
; ; Contents of postfix-fancy-transform.rkt
(define (postfix-run pgm args) ... )
(define (postfix-exec-commands cmds init-stk) ... )
(define (postfix-exec-command cmd stk) ... )
(define (postfix-program? sexp) ... )
(define postfix-arithops ... )
(define postfix-relops ... )
... many more definitions ...

; ; Sample program from lecture
(define pf1 '(postfix 2 2 nget 0 gt (sub)
  (swap 1 nget mul add) sel exec))
```

```
> (postfix-run '(postfix 2 1 nget mul swap 1 nget mul add)
  '(3 4))
25

> (map (λ (args) (postfix-run pf1 args)) '((3 5) (3 -5)))
'(2 28)
```

PostFix Syntactic Data Types

All PostFix code in these slides is from ~wx/cs251/sml/postfix/PostFix.sml

```
datatype pgm = PostFix of int * cmd list
and cmd = Pop | Swap | Nget | Sel | Exec
| Int of int
| Seq of cmd list
| Arithop of arithop
| Relop of relop
and arithop = Add | Sub | Mul | Div | Rem
and relop = Lt | Eq | Gt
```

```
(* SML syntax corresponding to s-expression syntax
  (postfix 2 2 nget 0 gt
    (sub) (swap 1 nget mul add) sel exec)) *)

val pf1 = PostFix(2, [Int 2, Nget, Int 0, Relop Gt,
  Seq[Arithop Sub],
  Seq[Swap, Int 1, Nget,
    Arithop Mul, Arithop Add],
  Sel, Exec])
```

PostFix Interpreter

```
(* Stack values are either ints or executable seqs *)
datatype stkval = IntVal of int | SeqVal of cmd list

exception ExecError of string (* runtime errors *)

(* val run : pgm -> int list -> int *)
fun run (PostFix(numargs, cmdbs)) args =
  if numargs = List.length args
  then case execCmds cmdbs (map IntVal args) of
    (IntVal v) :: _ => v
  | _ => raise ExecError
    "Sequence on top of final stack"
  else raise ExecError
    "Mismatch between expected and actual"
  ^ "number of args"

(* val execCmds : cmd list -> stkval list -> stkval list *)
and execCmds cmdbs vs = foldl (fn (cmd,stk) => execCmd cmd stk) vs cmd

(* val execCmd : cmd -> stkval list -> stkval list *)
and execCmd ... see the next page ...
```

PostFix and Sexps in SML 5

execCmd

```
(* Perform command on given stack and return resulting stack *)
and execCmd (Int i) vs = (IntVal i) :: vs
| execCmd (Seq cmdbs) vs = (SeqVal cmdbs) :: vs
| execCmd Pop (v :: vs) = vs
| execCmd Swap (v1 :: v2 :: vs) = v2 :: v1 :: vs
| execCmd Nget ((IntVal index) :: vs) = List.nth(vs, index-1) :: vs
| execCmd Sel (v_else :: v_then :: (IntVal v_test) :: vs) =
  (if v_test = 0 then v_else else v_then) :: vs
| execCmd Exec ((SeqVal cmdbs) :: vs) = execCmds cmdbs vs
| execCmd (Arithop a) ((IntVal i1) :: (IntVal i2) :: vs) =
  (IntVal ((arithopToFun a)(i2, i1))) :: vs
| execCmd (Relop r) ((IntVal i1) :: (IntVal i2) :: vs) =
  (IntVal (boolToInt( (rellopToFun r)(i2, i1)))) :: vs
| execCmd _ _ = raise ExecError "Unexpected Configuration"

and arithopToFun Add = op+
| arithopToFun Mul = op*
| arithopToFun Sub = op-
| arithopToFun Div = (fn(x,y) => x div y)
| arithopToFun Rem = (fn(x,y) => x mod y)

and rellopToFun Lt = op< | rellopToFun Eq = op= | rellopToFun Gt = op>

and boolToInt false = 0 | boolToInt true = 1
```

PostFix and Sexps in SML 6

Try it out

```
- run pf1 [3,5];
val it = 2 : int

- run pf1 [3,~5];
val it = 28 : int
```

PostFix and Sexps in SML 7

What About Errors?

```
- run (PostFix(1,[Arithop Add])) [3]
;uncaught exception ExecError raised at: postfix.sml:
49.25-49.61

- run (PostFix(1,[Seq [Arithop Add]])) [3]
;uncaught exception ExecError raised at: postfix.sml:
33.17-33.59

- run (PostFix(1,[Exec])) [3]
;uncaught exception ExecError raised at: postfix-
solns.sml:49.25-49.61

- run (PostFix(1,[Int 0, Arithop Div])) [3]
;uncaught exception Div [divide by zero] raised at:
postfix-solns.sml:57.38-57.41
```

Problems:

1. No error message printed
2. Stops at first error in a sequence of tests

PostFix and Sexps in SML 8

SML Exception Handling with handle

```
fun testRun pgm args =
  Int.toString (run pgm args)
handle ExecError msg => "ExecError: " ^ msg
  | General.Div => "Divide by zero error"
    (* General.Div from SML General basis structure;
       Need explicit qualification to distinguish
       from PostFix.Div *)
  | other => "Unknown exception: " ^ (exnMessage other)
```

```
'- testRun pf1 [3,~5];
val it = "28" : string (* no error here; returns int as string *)

- testRun (PostFix(1,[Arithop Add])) [3];
val it = "ExecError: Unexpected Configuration" : string
(* could modify program to give configuration details *)

- testRun (PostFix(1,[Seq [Arithop Add]])) [3];
val it = "ExecError: Sequence on top of final stack" : string

- testRun (PostFix(1,[Exec])) [3];
val it = "ExecError: Unexpected Configuration" : string

'- testRun (PostFix(1,[Int 0, Arithop Div])) [3];
val it = "Divide by zero error" : string
```

PostFix and Sexps in SML 9

Errors no longer halt execution/testing

```
- map (fn args => testRun (PostFix(2, [Arithop Div])) args)
=   [[3,7], [2,7], [0,5], [4,17]];
val it = ["2","3","Divide by zero error","4"] : string list
```

PostFix and Sexps in SML 10

Exception Handling in other Languages

SML's raise & handle like

- Java's throw and try/catch
- JavaScript's throw and try/catch
- Python's raise & try/except

No need for try in SML; you can attach handle to any expression (but might need to add extra parens).

PostFix and Sexps in SML 11

Exception Handling in other Languages

SML's raise & handle like

- Java's throw and try/catch
- JavaScript's throw and try/catch
- Python's raise & try/except

No need for try in SML; you can attach handle to any expression (but might need to add extra parens).

PostFix and Sexps in SML 12

SOP vs S-expression program representations

```
'(postfix 2 2 nget 0 gt
  (sub)
  (swap 1 nget mul add)
  sel exec)
```

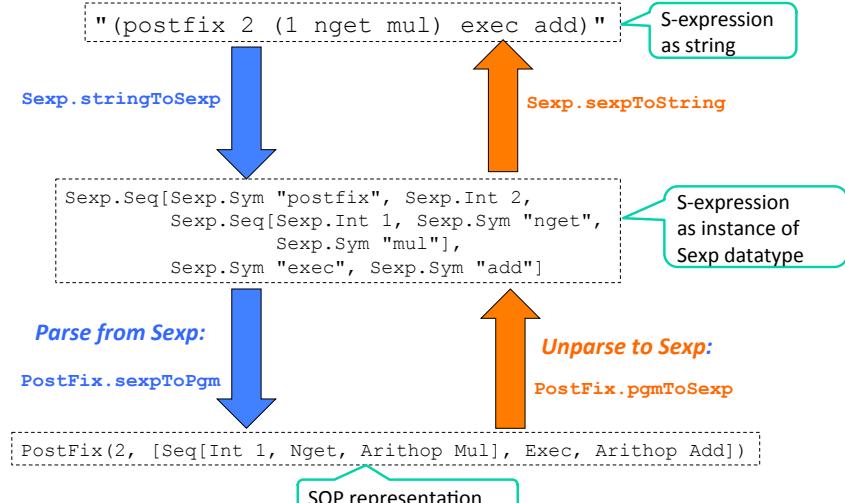

```
PostFix(2, [Int 2, Nget, Int 0, Relop Gt,
            Seq[Arithop Sub],
            Seq[Swap, Int 1, Nget,
                Arithop Mul, Arithop Add],
            Sel, Exec])
```

- S-expression notation is more compact
- Sum-of-product notation allows writing program directly as instance(s) of program datatype(s), which supports interpretation based on pattern matching

Can we somehow get the advantages of both?

PostFix and Sexps in SML 13

Idea: convert between SOP and S-expression reps using intermediate Sexp datatype

PostFix and Sexps in SML 14

Sexp datatype

```

signature SEXP = sig
  datatype sexp = Int of int
                 | Flt of real
                 | Str of string
                 | Chr of char
                 | Sym of string
                 | Seq of sexp list

exception IllFormedSexp of string
val isEqual : sexp * sexp -> bool
val stringToSexp : string -> sexp
val stringToSexps : string -> sexp list
val fileToSexp : string -> sexp
val fileToSexps : string -> sexp list
val sexpToString : sexp -> string
val sexpToString' : int -> sexp -> string
val sexpsToString : sexp list -> string
val sexpToFile : sexp -> string -> unit
val readSexp : unit -> sexp
end
  
```

This SEXP signature and Sexp structure can be found in ~wx/cs251/sml/sexp

```
structure Sexp :> SEXP =
  struct ... end
```

You can treat the Sexp structure As a black box. You needn't Understand how it works.

Sexps in SML 15

Sexp examples

```

- Sexp.stringToString "(17 3.141 'c' \"foo bar\" (\\"baz quux\\\" 1.5 42))";
(* Need to escape nested double quotes *)
val it =
  Seq
    [Int 17, Flt 3.141, Chr #"c", Str "foo bar",
     Seq [Str "baz quux", Flt 1.5, Int 42]] : Sexp.sexps

- Sexp.sexpToString it;
val it = "(17 3.141 'c' \"foo bar\" (\\"baz quux\\\" 1.5 42))" : string

- Sexp.stringToSexps "5 2.7 'Q' \"cs251\" () (1) (2 3)";
val it = [Int 5, Flt 2.7, Chr #'Q', Str "cs251", Seq [], Seq [Int 1], Seq
[Int 2, Int 3]] : Sexp.sexps
  
```

PostFix and Sexps in SML 16

Can read sexps from files:

```
; Contents of pgms.sexp

(postfix 2 1 nget mul) ; simple PostFix program

{ ; Curly braces are nestable block comments
  (postfix 1) ; silly program
  { (intex 0 17) ; Another silly program
  }

  (intex 2 (/ (+ ($ 1) ($ 2)) 2)) ; Intex averaging program

- Sexp.fileToSexp "pgms.sexp";
val it =
[Seq
 [Sym "postfix", Int 2, Int 1, Sym "nget", Sym "mul"],
 Seq
 [Sym "intex", Int 2,
 Seq
 [Sym "/"], Seq [Sym "+", Seq [Sym "$", Int 1], Seq [Sym "$", Int 2]], Int 2]]] : Sexp.sexp list
(* Note that line and block comments are ignored *)
```

PostFix and Sexps in SML 17

Parsing sexps to PostFix.cmd and PostFix.pgm

```
exception SyntaxError of string

fun SEXP_TO_PGM (Sexp.Seq(Sexp.Sym "postfix" :: Sexp.Int n :: cmdxs)) =
  PostFix(n, map SEXP_TO_CMD cmdxs)
| SEXP_TO_PGM SEXP = raise (SyntaxError ("invalid PostFix program: "
                                         ^ (Sexp.sexpToString SEXP)))

and SEXP_TO_CMD (Sexp.Int i) = Int i
| SEXP_TO_CMD (Sexp.Seq cmdxs) = Seq (map SEXP_TO_CMD cmdxs)
| SEXP_TO_CMD (Sexp.Sym "pop") = Pop
| SEXP_TO_CMD (Sexp.Sym "swap") = Swap
| SEXP_TO_CMD (Sexp.Sym "nget") = Nget
| SEXP_TO_CMD (Sexp.Sym "sel") = Sel
| SEXP_TO_CMD (Sexp.Sym "exec") = Exec
| SEXP_TO_CMD (Sexp.Sym "add") = Arithop Add
| SEXP_TO_CMD (Sexp.Sym "sub") = Arithop Sub
| SEXP_TO_CMD (Sexp.Sym "mul") = Arithop Mul
| SEXP_TO_CMD (Sexp.Sym "div") = Arithop Div
| SEXP_TO_CMD (Sexp.Sym "rem") = Arithop Rem
| SEXP_TO_CMD (Sexp.Sym "lt") = Relop Lt
| SEXP_TO_CMD (Sexp.Sym "eq") = Relop Eq
| SEXP_TO_CMD (Sexp.Sym "gt") = Relop Gt

and STRING_TO_CMD s = SEXP_TO_CMD (Sexp.stringToSexp s)
and STRING_TO_PGM s = SEXP_TO_PGM (Sexp.stringToSexp s)
```

PostFix and Sexps in SML 18

PostFix parsing examples

```
- map stringToCmd ["3", "pop", "add", "lt", "(1 nget mul)"];
val it = [Int 3, Pop, Arithop Add, Relop Lt, Seq [Int 1, Nget, Arithop Mul]] : cmd list

- stringToPgm "(postfix 2 2 nget 0 gt (sub) (swap 1 nget mul
  add) sel exec)";
val it =
  PostFix
  (2,
   [Int 2, Nget, Int 0, Relop Gt, Seq [Arithop Sub],
    Seq [Swap, Int 1, Nget, Arithop Mul, Arithop Add],
    Sel, Exec]) : pgm
```

PostFix and Sexps in SML 19

testRun' takes sexp strings

```
exception SEXP_ERROR of string * Sexp.sexp

fun testRun' pgmSexpString argsSexpString =
  testRun (stringToPgm pgmSexpString)
           (sexpStringToIntList argsSexpString)
  handle SEXP_ERROR (msg, SEXP) => ("SEXP_ERROR: " ^ msg ^ " "
                                         ^ (Sexp.sexpToString SEXP))
| SEXP.IllFormedSexp msg => ("SEXP_ERROR: Ill-formed SEXP "
                                ^ msg)
| other => "Unknown exception: " ^ (exnMessage other)

and SEXP_STRING_TO_INT_LIST str =
  let val SEXP = Sexp.stringToSexp str
  in case SEXP of
     Sexp.Seq xs => map SEXPToInt xs
     | _ => raise SEXP_ERROR("expected SEXP sequence but got", SEXP)
  end

and SEXPToInt (Sexp.Int i) = i
| SEXPToInt SEXP = raise SEXP_ERROR("expected SEXP int but got",
                                    SEXP)
```

PostFix and Sexps in SML 20

We've achieved our goal from beginning of lecture

```
- testRun' "(postfix 2 1 nget mul swap 1 nget mul add)" "(3 4)";
val it = "25" : string

- val pf1String = "(postfix 2 2 nget 0 gt (sub) (swap 1 nget mul add) sel
exec)";
val pf1String = "(postfix 2 2 nget 0 gt (sub) (swap 1 nget mul add) sel
exec)" : string

- map (testRun' pf1String) ["(3 5)", "(3 -5)];
val it = ["2","28"] : string list

(* The following examples illustrate some error cases *)
- testRun' "(postfix 1 1 get mul)" "(3)";
val it = "SyntaxError: unknown command get" : string

- testRun' "(postfix 1 1 nget mul" "(3)"
val it = "SexpError: Ill-formed sexp Sexp: end of input before matching right
paren -- (postfix 1 1 nget mul"

- testRun' "(postfix nget mul)" "(3)";
val it = "SyntaxError: invalid PostFix program: (postfix nget mul)" : string

- testRun' "(postfix 1 1 nget mul)" "3";
val it = "SexpError: expected sexp sequence but got 3" : string
```

PostFix and Sexps in SML 21

Unparsing PostFix.pgm and PostFix.cmd to sexps

```
fun pgmToSexp (PostFix(n,cmds)) =
  Sexp.Seq (Sexp.Sym "postfix" :: Sexp.Int n :: map cmdToSexp cmds)

and cmdToSexp (Int i) = Sexp.Int i
| cmdToSexp (Seq cmd) = Sexp.Seq (map cmdToSexp cmd)
| cmdToSexp Pop = Sexp.Sym "pop"
| cmdToSexp Swap = Sexp.Sym "swap"
| cmdToSexp Nget = Sexp.Sym "nget"
| cmdToSexp Sel = Sexp.Sym "sel"
| cmdToSexp Exec = Sexp.Sym "exec"
| cmdToSexp (Arithop Add) = Sexp.Sym "add"
| cmdToSexp (Arithop Sub) = Sexp.Sym "sub"
| cmdToSexp (Arithop Mul) = Sexp.Sym "mul"
| cmdToSexp (Arithop Div) = Sexp.Sym "div"
| cmdToSexp (Arithop Rem) = Sexp.Sym "rem"
| cmdToSexp (Relop Lt) = Sexp.Sym "lt"
| cmdToSexp (Relop Eq) = Sexp.Sym "eq"
| cmdToSexp (Relop Gt) = Sexp.Sym "gt"

and cmdToString s = Sexp.sexptoString (cmdToSexp s)
and pgmToString s = Sexp.sexptoString (pgmToSexp s)
```

PostFix and Sexps in SML 22

PostFix unparsing example

```
- pgmToString(PostFix(2, [Int 1, Nget, Int 3, Nget, Relop Lt,
=                      Seq[Arithop Sub],
=                      Seq[Swap, Int 1, Nget, Arithop Mul, Swap,
Arithop Add],
=                      Sel, Exec]));
val it = "(postfix 2 1 nget 3 nget lt (sub) (swap 1 nget mul swap
add) sel exec)" : string
```

PostFix and Sexps in SML 23
