

## The Pros of `cons`: Programming with Pairs and Lists

**CS251 Programming Languages**  
Spring 2016, Lyn Turbak

Department of Computer Science  
Wellesley College

### `cons` Glues Two Values into a Pair

A new kind of value:

- pairs (a.k.a. `cons` cells): `(cons v1 v2)`  
e.g.,

- `(cons 17 42)`
- `(cons 3.14159 #t)`
- `(cons "CS251" (λ (x) (* 2 x)))`
- `(cons (cons 3 4.5) (cons #f #\a))`

In Racket,  
type `Command-\`  
to get `λ char`

Can glue any number of values into a `cons` tree!

## Racket Values

- booleans: `#t`, `#f`
- numbers:
  - integers: 42, 0, -273
  - rationals: 2/3, -251/17
  - floating point (including scientific notation): 98.6, -6.125, 3.141592653589793, 6.023e23
  - complex: 3+2i, 17-23i, 4.5-1.4142i
- Note: some are *exact*, the rest are *inexact*. See docs.
- strings: `"cat"`, `"CS251"`, `"αβγ"`,  
`"To be\nor not\nto be"`
- characters: `#\a`, `#\A`, `#\5`, `#\space`, `#\tab`, `#\newline`
- anonymous functions: `(lambda (a b) (+ a (* b c)))`

What about compound data?

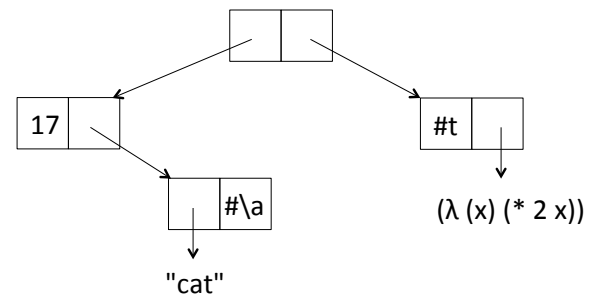

### Box-and-pointer diagrams for `cons` trees

`(cons v1 v2)`

<code>v1</code>	<code>v2</code>
-----------------	-----------------

Convention: put "small" values (numbers, booleans, characters) inside a box, and draw pointers to "large" values (functions, strings, pairs) outside a box.

```
(cons (cons 17 (cons "cat" #\a))
      (cons #t (λ (x) (* 2 x))))
```

## Evaluation Rules for cons

Big step semantics:

$$\frac{\begin{array}{l} e1 \downarrow v1 \\ e2 \downarrow v2 \end{array}}{(\text{cons } e1 \ e2) \downarrow (\text{cons } v1 \ v2)} \text{ (cons)}$$

Small-step semantics:

$(\text{cons } e1 \ e2)$

$\Rightarrow^* (\text{cons } v1 \ e2)$ ; first evaluate  $e1$  to  $v1$  step-by-step

$\Rightarrow^* (\text{cons } v1 \ v2)$ ; then evaluate  $e2$  to  $v2$  step-by-step

5-5

## cons evaluation example

```
(cons (cons (+ 1 2) (< 3 4))
      (cons (> 5 6) (* 7 8)))
⇒ (cons (cons 3 (< 3 4))
        (cons (> 5 6) (* 7 8)))
⇒ (cons (cons 3 #t) (cons (> 5 6) (* 7 8)))
⇒ (cons (cons 3 #t) (cons #f (* 7 8)))
⇒ (cons (cons 3 #t) (cons #f 56))
```

5-6

## car and cdr

- `car` extracts the left value of a pair

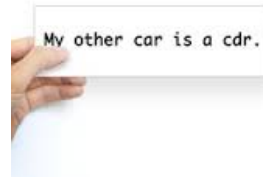

$(\text{car } (\text{cons } 7 \ 4)) \Rightarrow 7$

- `cdr` extract the right value of a pair

$(\text{cdr } (\text{cons } 7 \ 4)) \Rightarrow 4$

Why these names?

- `car` from “contents of address register”
- `cdr` from “contents of decrement register”

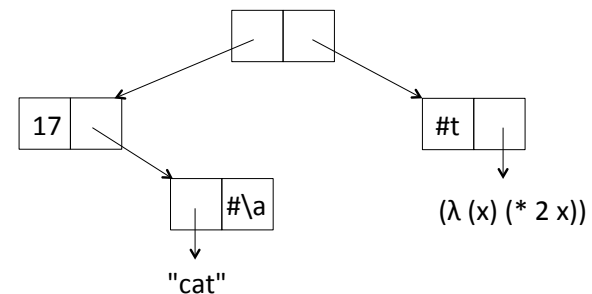

5-7

## Practice with car and cdr

Write expressions using `car`, `cdr`, and `tr` that extract the five leaves of this tree:

```
(define tr
  (cons (cons 17 (cons "cat" #\a))
        (cons #t (\lambda (x) (* 2 x))))
```

5-8

## cadr and friends

- `(caar e)` means `(car (car e))`
- `(cadr e)` means `(car (cdr e))`
- `(cdar e)` means `(cdr (car e))`
- `(cddr e)` means `(cdr (cdr e))`
- `(caaar e)` means `(car (car (car e)))`
- $\vdots$
- `(cddddr e)` means `(cdr (cdr (cdr (cdr e))))`

5-9

## Evaluation Rules for `car` and `cdr`

Big-step semantics:

$$\frac{e \downarrow (\text{cons } v1 \ v2)}{(\text{car } e) \downarrow v1} \quad (\text{car}) \qquad \frac{e \downarrow (\text{cons } v1 \ v2)}{(\text{cdr } e) \downarrow v2} \quad (\text{cdr})$$

Small-step semantics:

`(car e)`  
 $\Rightarrow^*$  `(car (cons v1 v2))`; first evaluate `e` to pair step-by-step  
 $\Rightarrow$  `v1`; then extract left value of pair

`(cdr e)`  
 $\Rightarrow^*$  `(car (cons v1 v2))`; first evaluate `e` to pair step-by-step  
 $\Rightarrow$  `v2`; then extract right value of pair

5-10

## Semantics Puzzle

According to the rules on the previous page, what is the result of evaluating this expression?

```
(car (cons (+ 2 3) (* 5 #t)))
```

Note: there are two “natural” answers. Racket gives one, but there are languages that give the other one!

5-11

## Printed Representations in Racket Interpreter

```
> (lambda (x) (* x 2))
#<procedure>

> (cons (+ 1 2) (* 3 4))
'(3 . 12)

> (cons (cons 5 6) (cons 7 8))
'((5 . 6) 7 . 8)

> (cons 1 (cons 2 (cons 3 4)))
'(1 2 3 . 4)
```

What’s going on here?

5-12

## Display Notation and Dotted Pairs

- The **display notation** for `(cons v1 v2)` is `(dn1 . dn2)`, where **dn1** and **dn2** are the display notations for **v1** and **v2**
- In display notation, a dot “eats” a paren pair that follows it directly:

```
((5 . 6) . (7 . 8))  
becomes (5 . 6) 7 . 8)
```

```
(1 . (2 . (3 . 4)))  
becomes (1 . (2 3 . 4))  
becomes (1 2 3 . 4)
```

Why? Because we'll see this makes lists print prettily.

- The Racket interpreter puts a single quote mark before the display notation of a top-level pair value. (We'll say more about quotation later.)

5-13

## display vs. print in Racket

```
> (display (cons 1 (cons 2 null)))  
(1 2)  
  
> (display (cons (cons 5 6) (cons 7 8)))  
((5 . 6) 7 . 8)  
  
> (display (cons 1 (cons 2 (cons 3 4))))  
(1 2 3 . 4)  
  
> (print(cons 1 (cons 2 null)))  
'(1 2)  
  
> (print(cons (cons 5 6) (cons 7 8)))  
'((5 . 6) 7 . 8)  
  
> (print(cons 1 (cons 2 (cons 3 4))))  
'(1 2 3 . 4)
```

5-14

## Functions Can Take and Return Pairs

```
(define (swap-pair pair)  
  (cons (cdr pair) (car pair)))  
  
(define (sort-pair pair)  
  (if (< (car pair) (cdr pair))  
      pair  
      (swap pair)))
```

What are the values of these expressions?

- `(swap-pair (cons 1 2))`
- `(sort-pair (cons 4 7))`
- `(sort-pair (cons 8 5))`

5-15

## Lists

In Racket, a **list** is just a recursive pattern of pairs.

A list is either

- The empty list `null`, whose display notation is `()`
- A nonempty list `(cons v_first v_rest)` whose
  - first element is **v\_first**
  - and the rest of whose elements are the sublist **v\_rest**

E.g., a list of the 3 numbers 7, 2, 4 is written

```
(cons 7 (cons 2 (cons 4 null)))
```

5-16

## Box-and-pointer notation for lists

A list of  $n$  values is drawn like this:

For example:

5-17

## list sugar

Treat `list` as syntactic sugar:

- `(list)` desugars to `null`
- `(list e1 ...)` desugars to `(cons e1 (list ...))`

For example:

```
(list (+ 1 2) (* 3 4) (< 5 6))
```

```
desugars to (cons (+ 1 2) (list (* 3 4) (< 5 6)))
```

```
desugars to (cons (+ 1 2) (cons (* 3 4) (list (< 5 6))))
```

```
desugars to (cons (+ 1 2) (cons (* 3 4) (cons (< 5 6) (list))))
```

```
desugars to (cons (+ 1 2) (cons (* 3 4) (cons (< 5 6) null)))
```

\* This is a white lie, but we can pretend it's true for now

5-18

## Display Notation for Lists

The “dot eats parens” rule makes lists display nicely:

```
(list 7 2 4)
```

```
desugars to (cons 7 (cons 2 (cons 4 null))))
```

```
displays as (before rule) (7 . (2 . (4 . ())))
```

```
displays as (after rule) (7 2 4)
```

```
prints as '(7 2 4)
```

In Racket:

```
> (display (list 7 2 4))
(7 2 4)
```

```
> (display (cons 7 (cons 2 (cons 4 null))))
(7 2 4)
```

5-19

## list and small-step evaluation

It is sometimes helpful to both desugar and resugar with `list`:

```
(list (+ 1 2) (* 3 4) (< 5 6))
```

```
desugars to (cons (+ 1 2) (cons (* 3 4) (cons (< 5 6) null)))
```

```
⇒ (cons 3 (cons (* 3 4) (cons (< 5 6) null)))
```

```
⇒ (cons 3 (cons 12 (cons (< 5 6) null)))
```

```
⇒ (cons 3 (cons 12 (cons #t null)))
```

```
resugars to (list 3 12 #t)
```

Heck, let's informally write this as:

```
(list (+ 1 2) (* 3 4) (< 5 6))
```

```
⇒ (list 3 (* 3 4) (< 5 6))
```

```
⇒ (list 3 12 (cons (< 5 6))
```

```
⇒ (list 3 12 #t)
```

5-20

## first, rest, and friends

- `first` returns the first element of a list:  
`(first (list 7 2 4)) ⇒ 7`  
(`first` is almost a synonym for `car`, but requires its argument to be a list)
- `rest` returns the sublist of a list containing every element but the first:  
`(rest (list 7 2 4)) ⇒ (list 2 4)`  
(`rest` is almost a synonym for `cdr`, but requires its argument to be a list)
- Also have `second`, `third`, ..., `ninth`, `tenth`

5-21

## Recursive List Functions

Because lists are defined recursively, it's natural to process them recursively.

Typically (but not always) a recursive function `recf` on a list argument `L` has two cases:

- **base case:** what does `recf` return when `L` is empty? (Use `null?` to test for an empty list)
- **recursive case:** if `L` is the nonempty list `(cons v_first v_rest)` how are `v_first` and `(recf v_rest)` combined to give the result for `(recf L)`?

Note that we “blindly” apply `recf` to `v_rest`!

5-22

## Example: sum

`(sum ns)` returns the sum of the numbers in the list `ns`

```
(define (sum ns)
  (if (null? ns)
      0
      (+ (first ns)
         (sum (rest ns)))))
```

5-23

## Understanding sum: Approach #1

`(sum (list 7 2 4))`

We'll call this the **recursive accumulation** pattern

5-24

## Understanding sum: Approach #2

In `(sum (list 7 2 4))`, the list argument to `sum` is

```
(cons 7 (cons 2 (cons 4 null)))
```

Replace `cons` by `+` and `null` by `0` and simplify:

```
(+ 7 (+ 2 (+ 4 0)))
```

```
⇒ (+ 7 (+ 2 4))
```

```
⇒ (+ 7 6)
```

```
⇒ 13
```

5-25

## Generalizing sum: Approach #1

```
(recf (list 7 2 4))
```

5-26

## Generalizing sum: Approach #2

In `(recf (list 7 2 4))`, the list argument to `recf` is

```
(cons 7 (cons 2 (cons 4 null)))
```

Replace `cons` by `combine` and `null` by `nullval` and simplify:

```
(combine 7 (combine 2 (combine 4 nullval)))
```

5-27

## Generalizing the sum definition

```
(define (recf ns)
  (if (null? ns)
      nullval
      (combine (first ns)
               (recf (rest ns)))))
```

5-28

## Your turn

(product ns) returns the product of the numbers in ns

(min-list ns) returns the minimum of the numbers in ns

*Hint: use min and +inf.0 (positive infinity)*

(max-list ns) returns the maximum of the numbers in ns

*Hint: use max and -inf.0 (negative infinity)*

(all-true? bs) returns #t if all the elements in bs are truthy; otherwise returns #f. *Hint: use and*

(some-true? bs) returns a truthy value if at least one element in bs is truthy; otherwise returns #f. *Hint: use or*

(my-length xs) returns the length of the list xs

5-29

## Recursive Accumulation Pattern Summary

	combine	nullval
sum	+	0
product	*	1
min-list	min	+inf.0
max-list	max	-inf.0
all-true?	and	#t
some-true?	or	#f
my-length	( $\lambda$ (fst subres) (+ 1 subres))	0

5-30

## Mapping Example: map-double

(map-double ns) returns a new list the same length as ns in which each element is the double of the corresponding element in ns.

```
> (map-double (list 7 2 4))  
'(14 4 8)
```

```
(define (map-double ns)  
  (if (null? ns)  
      ; Flesh out base case  
  
      ; Flesh out recursive case  
  ))
```

5-31

## Understanding map-double

```
(map-double (list 7 2 4))
```

We'll call this the **mapping** pattern

5-32

## Generalizing map-double

(map $F$  (list  $v1$   $v2$  ...  $vn$ ))

```
(define (map $F$  xs)
  (if (null? xs)
      null
      (cons (F (first xs))
            (map $F$  (rest xs))))))
```

5-33

## Expressing map $F$ as an accumulation

```
(define (map $F$  xs)
  (if (null? xs)
      null
      ((λ (fst subres)
         ) ; Flesh this out
       (first xs)
       (map $F$  (rest xs)))))
```

5-34

## Some Recursive Listfuns Need Extra Args

```
(define (map-scale  $factor$  ns)
  (if (null? ns)
      null
      (cons (*  $factor$  (first ns))
            (map-scale  $factor$  (rest ns)))))
```

5-35

## Filtering Example: filter-positive

(filter-positive ns) returns a new list that contains only the positive elements in the list of numbers ns, in the same relative order as in ns.

```
> (filter-positive (list 7 -2 -4 8 5))
'(7 8 5)
```

```
(define (filter-positive ns)
  (if (null? ns)
      ; Flesh out base case

      ; Flesh out recursive case

  ))
```

5-36

## Understanding filter-positive

(filter-positive (list 7 -2 -4 8 5))

We'll call this the **filtering** pattern

5-37

## Generalizing filter-positive

(filter<sup>P</sup> (list *v1 v2 ... vn*))

```
(define (filterP xs)
  (if (null? xs)
      null
      (if (P (first xs))
          (cons (first xs) (filterP (rest xs)))
          (filterP (rest xs)))))
```

5-38

## Expressing filter<sup>P</sup> as an accumulation

```
(define (filterP xs)
  (if (null? xs)
      null
      ((lambda (fst subres)
         ; Flesh this out
         (first xs)
         (filterP (rest xs))))))
```

5-39

## More examples

- snoc/postpend
- append
- append-all
- sorted?
- merge

5-40
