

Iteration via Tail Recursion in Racket

CS251 Programming Languages

Spring 2016, Lyn Turbak

Department of Computer Science
Wellesley College

8-2

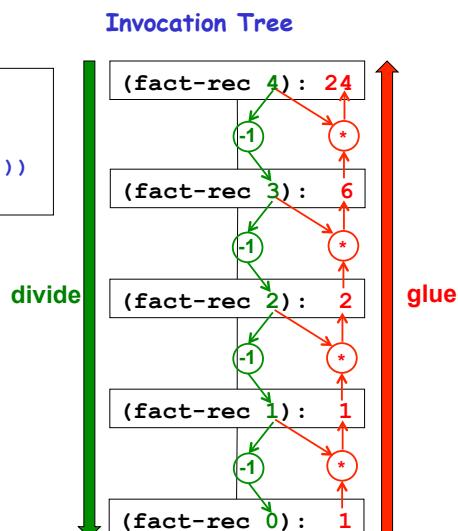

Overview

- What is iteration?
- Racket has no loops, and yet can express iteration.
How can that be?
 - Tail recursion!
- Tail recursive list processing via `foldl`
- Other useful abstractions
 - Recursive list generation via `genlist` (can make iterative)
 - General iteration via `iterate`

Factorial Revisited

```
(define (fact-rec n)
  (if (= n 0)
      1
      (* n (fact-rec (- n 1)))))
```

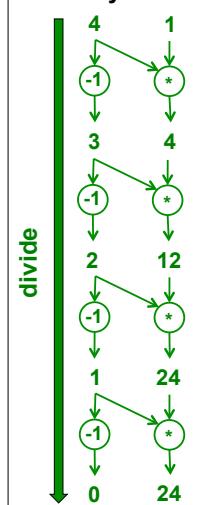

pending multiplication
is nontrivial glue step

8-3

An iterative approach to factorial

Idea: multiply on way down

State Variables:

- `num` is the current number being processed.
- `ans` is the product of all numbers already processed.

Iteration Table:

Step	num	ans
1	4	1
2	3	4
3	2	12
4	1	24
5	0	24

Iteration Rules:

- next `num` is previous `num` minus 1.
- next `ans` is previous `num` times previous `ans`.

Iteration

8-4

Iterative factorial: tail recursive version

Iteration Rules:

- next num is previous num minus 1.
- next ans is previous num times previous ans.

```
(define (fact-tail num ans)
  (if (= num 0)
      ans
      (fact-tail (- num 1) (* num ans))))
```

stopping condition

```
; Here, and in many tail recursions, need a wrapper
; function to initialize first row of iteration
; table. E.g., invoke (fact-iter 4) to calculate 4!
(define (fact-iter n)
  (fact-tail n 1))
```

8-5

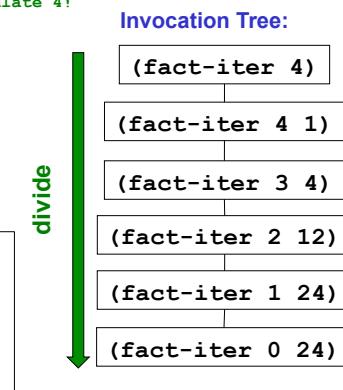

Tail-recursive factorial: invocation tree

```
; Here, and in many tail recursions, need a wrapper
; function to initialize first row of iteration
; table. E.g., invoke (fact-iter 4) to calculate 4!
(define (fact-iter n)
  (fact-tail n 1))
```

```
(define (fact-tail num ans)
  (if (= num 0)
      ans
      (fact-tail (- num 1) (* num ans))))
```

Iteration Table:

step	num	ans
1	4	1
2	3	4
3	2	12
4	1	24
5	0	24

8-6

The essence of iteration in Racket

- A process is **iterative** if it can be expressed as a sequence of steps that is repeated until some stopping condition is reached.
- In divide/conquer/glue methodology, an iterative process is a recursive process with a single subproblem and no glue step.
- Each recursive method call is a **tail call** -- i.e., a method call with no pending operations after the call. When all recursive calls of a method are tail calls, it is said to be **tail recursive**. A tail recursive method is one way to specify an iterative process.

Iteration is so common that most programming languages provide special constructs for specifying it, known as **loops**.

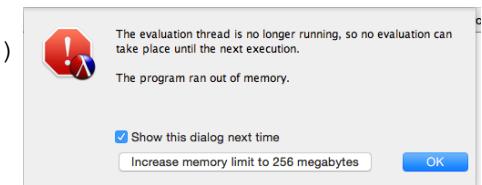

8-7

inc-rec in Racket

```
; Extremely silly and inefficient recursive incrementing
; function for testing Racket stack memory limits
(define (inc-rec n)
  (if (= n 0)
      1
      (+ 1 (inc-rec (- n 1)))))
```

```
> (inc-rec 1000000) ; 10^6
1000001
```

```
> (inc-rec 10000000)
; 10^7
```

8-8

inc_rec in Python

```
def inc_rec (n):
    if n == 0:
        return 1
    else:
        return 1 + inc_rec(n - 1)
```

```
In [16]: inc_rec(100)
Out[16]: 101
```

```
In [17]: inc_rec(1000)
...
```

```
/Users/fturbak/Desktop/lyn/courses/cs251-archive/cs251-s16/slides-lyn-s16/racket-tail/iter.py in
inc_rec(n)
    9     return 1
    10    else:
--> 11    return 1+inc_rec(n - 1)
   12 # inc_rec(10) => 11
   13 # inc_rec(100) => 101
```

RuntimeError: maximum recursion depth exceeded

8-9

inc-iter/inc-tail in Racket

```
(define (inc-iter n)
  (inc-tail n 1))

(define (inc-tail num resultSoFar)
  (if (= num 0)
      resultSoFar
      (inc-tail (- num 1) (+ resultSoFar 1))))
```

```
> (inc-iter 10000000) ; 10^7
10000001
```

```
> (inc-iter 100000000) ; 10^8
100000001
```

Will inc-iter ever run out of memory?

8-10

inc_iter/int_tail in Python

```
def inc_iter (n): # Not really iterative!
    return inc_tail(n, 1)

def inc_tail(num, resultSoFar):
    if num == 0:
        return resultSoFar
    else:
        return inc_tail(num - 1, resultSoFar + 1)
```

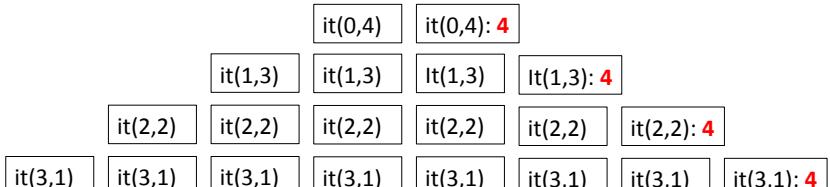

```
In [19]: inc_iter(100)
Out[19]: 101
```

```
In [19]: inc_iter(1000)
...
```

RuntimeError: maximum recursion depth exceeded

8-11

Why the Difference?

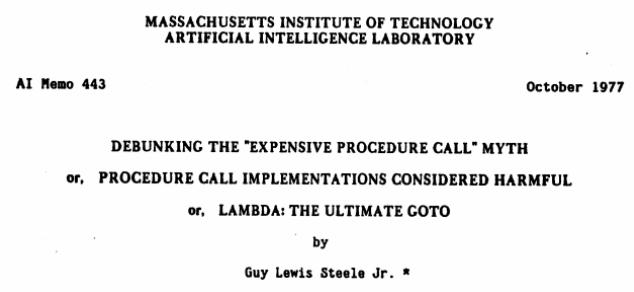

Python pushes a stack frame for every call to iter_tail. When iter_tail(0,4) returns the answer 4, the stacked frames must be popped even though no other work remains to be done coming out of the recursion.

Racket's tail-call optimization replaces the current stack frame with a new stack frame when a tail call (function call not in a subexpression position) is made. When iter-tail(0,4) returns 4, no unnecessarily stacked frames need to be popped!

8-12

Origins of Tail Recursion

Guy Lewis Steele
a.k.a. "The Great Quux"

- One of the most important but least appreciated CS papers of all time
- Treat a function call as a GOTO that passes arguments
- Function calls should not push stack; subexpression evaluation should!
- Looping constructs are unnecessary; tail recursive calls are a more general and elegant way to express iteration.

8-13

What to do in Python (and most other languages)?

In Python, **must** re-express the tail recursion as a loop!

```
def inc_loop (n):  
    resultSoFar = 0  
    while n > 0:  
        n = n - 1  
        resultSoFar = resultSoFar + 1  
    return resultSoFar
```

In [23]: inc_loop(1000) # 10^3
Out[23]: 1001

In [24]: inc_loop(10000000) # 10^8
Out[24]: 10000001

But Racket doesn't need loop constructs because tail recursion suffices for expressing iteration!

8-14

Iterative factorial: Python `while` loop version

Iteration Rules:

- next `num` is previous `num` minus 1.
- next `ans` is previous `num` times previous `ans`.

```
def fact_while(n):  
  
    num = n } Declare/initialize local  
    ans = 1 } state variables  
  
    while (num > 0):  
        ans = num * ans } Calculate product and  
        num = num - 1 } decrement num  
  
    return ans } Don't forget to return answer!
```

8-15

`while` loop factorial: Execution Land

Execution frame for `fact_while(4)`

n	num	ans
4	4	1
	3	
	2	
	1	
	0	

num = n
ans = 1

→ while (num > 0):
 ans = num * ans
 num = num - 1

return ans

step	num	ans
1	4	1
2	3	4
3	2	12
4	1	24
5	0	24

8-16

Gotcha! Order of assignments in loop body

What's wrong with the following loop version of factorial?

```
def fact_while(n):
    num = n
    ans = 1
    while (num > 0):
        num = num - 1
        ans = num * ans
    return ans
```

Moral: must think carefully about order of assignments in loop body!

Note:
tail recursion
doesn't have
this gotcha!

```
(define (fact-tail num ans)
  (if (= num 0)
      ans
      (fact-tail (- num 1) (* num ans))))
```

8-17

Relating Tail Recursion and while loops

```
(define (fact-iter n)
  (fact-tail n 1))

(define (fact-tail num ans)
  (if (= num 0)
      ans
      (fact-tail (- num 1) (* num ans))))
```

Initialize variables

fact-tail

When done,
return ans

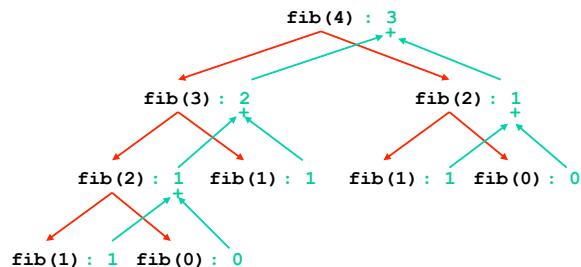

```
def fact_while(n):
    num = n
    ans = 1
    while (num > 0):
        num = num - 1
        ans = num * ans
    return ans
```

While
not done,
update
variables

8-18

Recursive Fibonacci

```
(define (fib-rec n) ; returns rabbit pairs at month n
  (if (< n 2) ; assume n >= 0
      n
      (+ (fib-rec (- n 1)) ; pairs alive last month
          (fib-rec (- n 2)) ; newborn pairs
          )))
```

8-19

Iteration leads to a more efficient Fib

The Fibonacci sequence: 0, 1, 1, 2, 3, 5, 8, 13, 21, ...

Iteration table for calculating the 8th Fibonacci number:

n	i	fib_i	fib_i_plus_1
8	0	0	1
8	1	1	1
8	2	1	2
8	3	2	3
8	4	3	5
8	5	5	8
8	6	8	13
8	7	13	21
8	8	21	34

8-20

Iterative Fibonacci in Racket

Flesh out the missing parts

```
(define (fib-iter n)
  (fib-tail ...))

(define (fib-tail n i fib_i fib_i_plus_1)
  ...
  )

)
```

8-21

Fixing Gotcha

1. Use a temporary variable (in general, might need $n-1$ such vars for n state variables)

```
def fib_for_fixed1(n):
    fib_i= 0
    fib_i_plus_1 = 1
    for i in range(n):
        fib_i_prev = fib_i
        fib_i = fib_i_plus_1
        fib_i_plus = fib_i_prev + fib_i_plus_1
    return fib_i
```

2. Use simultaneous assignment:

```
def fib_for_fixed2(n):
    fib_i= 0
    fib_i_plus_1 = 1
    for i in range(n):
        (fib_i, fib_i_plus_1) =\
            (fib_i_plus_1, fib_i + fib_i_plus_1)
    return fib_i
```

8-23

Gotcha! Assignment order and temporary variables

What's wrong with the following looping versions of Fibonacci?

```
def fib_for1(n):
    fib_i= 0
    fib_i_plus_1 = 1
    for i in range(n):
        fib_i = fib_i_plus_1
        fib_i_plus_1 = fib_i + fib_i_plus_1
    return fib_i
```

```
def fib_for2(n):
    fib_i= 0
    fib_i_plus_1 = 1
    for i in range(n):
        fib_i_plus_1 = fib_i + fib_i_plus_1
        fib_i = fib_i_plus_1
    return fib_i
```

Moral: sometimes no order of assignments to state variables in a loop is correct and it is necessary to introduce one or more **temporary variables** to save the previous value of a variable for use in the right-hand side of a later assignment.

Or can use **simultaneous assignment** in languages that have it (like Python!)

8-22

Iterative list summation

Iteration table

L	result
'(6 3 -22 5)	0
'(3 -22 5)	6
'(-22 5)	9
'(5)	-13
'()	-8

8-24

Capturing list iteration via my-foldl

```
(define (my-foldl combiner resultSoFar xs)
  (if (null? xs)
      resultSoFar
      (my-foldl combiner
                 (combiner (first xs) resultSoFar)
                 (rest xs))))
```

8-25

my-foldl Examples

```
> (my-foldl + 0 (list 7 2 4))

> (my-foldl * 1 (list 7 2 4))

> (my-foldl cons null (list 7 2 4))

> (my-foldl (λ (n res) (+ (* 10 res) n))
  0
  (list 7 2 4))
```

8-26

Built-in Racket foldl Function Folds over Any Number of Lists

```
> (foldl cons null (list 7 2 4))
'(4 2 7)

> (foldl (λ (a b res) (+ (* a b) res))
  0
  (list 2 3 4)
  (list 5 6 7))
56

> (foldl (λ (a b res) (+ (* a b) res))
  0
  (list 1 2 3 4)
  (list 5 6 7))
> ERROR: foldl: given list does not have the same
size as the first list: '(5 6 7)
```

8-27

Iterative vs Recursive List Reversal

```
(define (reverse-iter xs)
  (foldl cons null xs))

(define (reverse-rec xs)
  (foldr (flip2 snoc) null xs))

(define (snoc ys x)
  (foldr cons (list x) ys))
```

8-28

What does this do?

```
(define (whatisit f xs)
  (foldl (λ (x listSoFar)
    (cons (f x) listSoFar)))
  null
  xs))
```

8-29

genlist

```
(define (genlist next done? seed)
  (if (done? seed)
    null
    (cons seed
      (genlist next done? (next seed))))))
```

```
> (genlist (λ (n) (- n 1))
  (λ (n) (= n 0)))
  5)

> (genlist (λ (n) (* n 2))
  (λ (n) (> n 100)))
  1)
```

Because of the pending conses, this genlist is **not iterative
(but we'll see soon how to make it iterative)**

8-30

Your Turn

```
(my-range lo hi)
> (my-range 10 20)
'(10 11 12 13 14 15 16 17 18 19)

> (my-range 20 10)
'()
```

```
(halves num)
> (halves 64)
'(64 32 16 8 4 2 1)

> (halves 42)
'(42 21 10 5 2 1)

> (halves 63)
'(63 31 15 7 3 1)
```

8-31

iterate

```
(define (iterate next done? finalize state)
  (if (done? state)
    (finalize state)
    (iterate next done? finalize
      (next state))))
```

```
(define (fact-iterate n)
  (iterate (λ (num&prod)
    (list (- (first num&prod) 1)
      (* (first num&prod)
        (second num&prod))))
    (λ (num&prod) (<= (first num&prod) 0))
    (λ (num&prod) (second num&prod))
    (list n 1))))
```

8-32

Your Turn

```
(define (least-power-geq base threshold)
  (iterate ??? ; next
            ??? ; done?
            ??? ; finalize
            ??? ; initial state
  ))
```

```
> (least-power-geq 2 10)
16
```

```
> (least-power-geq 5 100)
125
```

```
> (least-power-geq 3 100)
243
```

How could we return just the exponent rather than the base raised to the exponent?

8-33

What do These Do?

```
(define (mystery1 n) ; Assume n >= 0
  (iterate (λ (ns) (cons (- (first ns) 1) ns))
           (λ (ns) (<= (first ns) 0))
           (λ (ns) ns)
           (list n)))
```

```
(define (mystery2 n)
  (iterate (λ (ns) (cons (quotient (first ns) 2) ns))
           (λ (ns) (<= (first ns) 1))
           (λ (ns) (- (length ns) 1))
           (list n)))
```

8-34

Using let to introduce local names

```
(define (fact-let n)
  (iterate (λ (num&prod)
            (let ([num (first num&prod)]
                  [prod (second num&prod)])
              (list (- num 1) (* num prod))))
           (λ (num&prod) (<= (first num&prod) 0))
           (λ (num&prod) (second num&prod))
           (list n 1)))
```

8-35

Using match to introduce local names

```
(define (fact-match n)
  (iterate (λ (num&prod)
            (match num&prod
                  [(list num prod)
                   (list (- num 1) (* num prod))])
            (λ (num&prod) (<= (first num&prod) 0))
            (λ (num&prod) (second num&prod))
            (list n 1)))
```

8-36

apply and iterate-apply

```
> ((λ (a b c) (+ (* a b) c)) 2 3 4)
10
> (apply (λ (a b c) (+ (* a b) c)) (list 2 3 4))
10
```

```
(define (iterate-apply next done? finalize state)
  (if (apply done? state)
      (apply finalize state)
      (iterate-apply next done? finalize
                    (apply next state))))
```

```
(define (fact-iterate-apply n)
  (iterate-apply (λ (num prod)
                  (list (- num 1) (* num prod)))
                (λ (num prod) (≤ num 0))
                (λ (num prod) prod)
                (list n 1)))
```

8-37

Your Turn

```
(define (fib-iterate-apply n)
  (iterate-apply ??? ; next
                ??? ; done?
                ??? ; finalize
                ??? ; initial state
                ))
```

n	i	fib_i	fib_i_plus_1
8	0	0	1
8	1	1	1
8	2	1	2
8	3	2	3
8	4	3	5
8	5	5	8
8	6	8	13
8	7	13	21
8	8	21	34

8-38

An Iterative Version of genlist

```
(define (genlist-iter next done? seed)
  (iterate (λ (elts) (cons (next (first elts)) elts))
           (λ (elts) (done? (first elts)))
           (λ (elts) (reverse (rest elts)))
           ; Eliminate done seed & reverse list
           (list seed)))
```

Example: How does this work?

```
(genlist-iter (λ (n) (quotient n 2))
              (λ (n) (≤ n 0))
              5)
```

8-39
