Sum-of-Product Datatypes in SML

Motivating example: geometric figures

Suppose we want to represent geometric figures like circles, rectangles, and triangles so that we can do things like calculate their perimeters, scale them, etc. (Don’t worry about drawing them!)

These are so-called sum of products data:
- Circle, Rect, and Tri are tags that distinguish which one in a sum
- The numeric children of each tag are the product associated with that tag.

How would you do this in Java? In Python?

SML’s datatype for Sum-of-Product types

```sml
datatype figure =
  Circ of real (* radius *)
| Rect of real * real (* width, height *)
| Tri of real * real * real (* side1, side2, side3 *)

val figs = [Circ 1.0, Rect (2.0,3.0), Tri(4.0,5.0,6.0)] (* List of sample figures *)

val circs = map Circ [7.0, 8.0, 9.0] (* List of three circles *)
```

Functions on datatype via pattern matching

```sml
(* Return perimeter of figure *)
fun perim (Circ r) = 2.0 * Math.pi * r
  | perim (Rect(w,h)) = 2.0 * (w + h)
  | perim (Tri(s1,s2,s3)) = s1 + s2 + s3

(* Scale figure by factor n *)
fun scale n (Circ r) = Circ (n * r)
  | scale n (Rect(w,h)) = Rect (n*w, n*h)
  | scale n (Tri(s1,s2,s3)) = Tri (n*s1, n*s2, n*s3)

val perims = map perim figs
val perims = [6.28318530718, 10.0, 15.0]

val scaledFigs = map (scale 3.0) figs
val scaledFigs = [Circ 3.0, Rect (6.0,9.0), Tri (12.0,15.0,18.0)]
```
Options

SML has a built-in option datatype defined as follows:

```
datatype 'a option = NONE | SOME of 'a
```

- NONE
  - val it = NONE : 'a option
- SOME 3;
  - val it = SOME 3 : int option
- SOME true;
  - val it = SOME true : bool option

Sample Use of Options

- fun into_100 n = if (n = 0) then NONE else SOME (100 div n);
  - val into_100 = fn : int -> int option
- List.map into_100 [5, 3, 0, 10];
  - val it = [SOME 20,SOME 33,NONE,SOME 10] : int option list
- fun addOptions (SOME x) (SOME y) = SOME (x + y)
  - | addOptions (SOME x) NONE = NONE
  - | addOptions NONE (SOME y) = NONE
  - | addOptions NONE NONE = NONE;
  - val addOptions = fn : int option -> int option -> int option
- addOptions (into_100 5) (into_100 10);
  - val it = SOME 30 : int option
- addOptions (into_100 5) (into_100 0);
  - val it = NONE : int option

Options and List.find

(* List.find : ('a -> bool) -> 'a list -> 'a option *)
- List.find (fn y => (y mod 2) = 0) [5,8,4,1];
  - val it = SOME 8 : int option
- List.find (fn z => z < 0) [5,8,4,1];
  - val it = NONE : int option

Thinking about options

What problem do options solve?

How is the problem solved in other languages?
Creating our own list datatype

datatype 'a mylist = Nil | Cons of 'a * 'a mylist

val ints = Cons(1, Cons(2, Cons(3, Nil))) (* : int mylist *)
val strings = Cons("foo", Cons("bar", Cons("baz", Nil))) (* : strings mylist *)

fun myMap f Nil = Nil
  | myMap f (Cons(x,xs)) = Cons(f x, myMap f xs) (* : ('a -> 'b) -> 'a mylist -> 'b mylist *)

val incNums = myMap (fn x => x + 1) ints (* val incNums = Cons(2,Cons(3,Cons(4,Nil))) : int mylist *)
val myStrings = myMap (fn s => "my " ^ s) strings (* val myStrings = Cons("my foo", Cons("my bar", Cons("my baz",Nil))) : string mylist *)

SML bintree datatype for Binary Trees

datatype 'a bintree = Leaf
  | Node of 'a bintree * 'a * 'a bintree
      (* left subtree, value, right subtree *)

val int_tree = Node(Node(Leaf, 2, Leaf),
                     4,
                     Node(Node(Leaf, 1, Node(Leaf, 5, Leaf)),
                          6,
                          Node(Leaf, 3, Leaf)))

val int_tree = Node(Node(Leaf, 2, Leaf),
                     4,
                     Node(Node(Leaf, 1, Node(Leaf, 5, Leaf)),
                          6,
                          Node(Leaf, 3, Leaf)))

bintree can have any type of element

val string_tree = Node(Node(Leaf,"like",Leaf),
                        "green",
                        Node(Node(Leaf,"and",Leaf),
                             "eggs",
                             Node(Leaf,"ham",Leaf)))

val string_tree = Node(Node(Leaf,"like",Leaf),
                        "green",
                        Node(Node(Leaf,"and",Leaf),
                             "eggs",
                             Node(Leaf,"ham",Leaf)))
### Counting nodes in a binary tree

```
fun num_nodes Leaf = 0
| num_nodes (Node(l,v,r)) = 1 + (num_nodes l) + (num_nodes r)
```

- num_nodes int_tree;
val it = 6 : int
- num_nodes_string_tree;
val it = 5 : int

Sum-of-Product Datatypes in SML. 13

### Your turn: height

```
(* val height = fn : 'a bintree -> int *)
(* Returns the height of a binary tree. *)
(* Note: Int.max returns the max of two ints *)

fun height Leaf =
| height (Node(l,v,r)) =
```

- height int_tree;
val it = 4 : int
- height_string_tree;
val it = 3 : int

Sum-of-Product Datatypes in SML. 14

### Your turn: sum_nodes

```
(* val sum_nodes = fn : int bintree -> int *)
(* Returns the sum of node values in binary tree of ints *)

fun sum_nodes Leaf =
| sum_nodes (Node(l,v,r)) =
```

- sum_nodes int_tree;
val it = 21 : int

Sum-of-Product Datatypes in SML. 15

### Your turn: inlist

```
(* val inlist = fn : 'a bintree -> 'a list *)
(* Returns a list of the node values in in-order *)

fun inlist Leaf =
| inlist (Node(l,v,r)) =
```

- inlist int_tree;
val it = [2,4,1,5,6,3] : int list
- inlist_string_tree;
val it = ["like","green","eggs","and","ham"] : string list

Sum-of-Product Datatypes in SML. 16
Your turn: map_tree

```sml
(* val map_tree = fn : ('a -> 'b) -> 'a bintree -> 'b bintree *)
(* maps function over every node in a binary tree *)
fun map_tree f Leaf =
  | map_tree f (Node(l,v,r)) =

- map_tree (fn x => x*2) int_tree;
val it = Node (Node (Node (Leaf,1,Leaf),4,Leaf),2,Leaf) : int bintree
- map_tree (fn s => String.sub(s,0)) string_tree;
val it = Node (Node (Leaf,1,Leaf),2,Leaf) : char bintree
```

Your turn: fold_tree

```sml
(* val fold_tree = fn : ('b * 'a * 'b) -> 'b bintree -> 'b *)
(* binary tree accumulation *)
fun fold_tree comb leafval Leaf =
  | fold_tree comb leafval (Node(l,v,r)) =

- fold_tree (fn (lsum,v,rsum) => lsum + v + rsum) 0 int_tree;
val it = 21 : int
- fold_tree (fn (lstr,v,rstr) => lstr ^ v ^ rstr) " " string_tree;
val it = " like green eggs and ham " : string
```

You turn: Binary Search Tree insertion

```sml
fun singleton v = Node(Leaf, v, Leaf)

(* val insert : 'a bintree -> 'a -> 'a bintree *)
fun insert x Leaf =
  | insert x (t as (Node(l,v,r))) =
    if x = v then
    else if x < v then
    else

fun listToTree xs =

- val test_bst = listToTree [4,2,3,6,1,7,5];
val test_bst = Node (Node (Node (Leaf,1,Leaf),2,Leaf),
  4,Node (Node (Leaf,3,Leaf)),
  6,Node (Leaf,7,Leaf))) : int bintree
```

Binary Search Trees (BSTs) on integers
Your turn: Binary Search Tree membership

```sml
(val member: 'a -> 'a bintree -> bool *)
fun member x Leaf =
    | member x (Node(l,v,r)) =

- val test_member = map (fn i => (i, member i test_bst)) [0,1,2,3,4,5,6,7,8];

val it = [(0,false),(1,true),(2,true),(3,true),
(4,true),(5,true),(6,true),(7,true), (8,false)] : (int * bool) list
```

Balanced Trees (PS6)

BSTs are not guaranteed to be balanced.
But there are other tree data structures that do guarantee balance: AVL trees, Red/Black trees, 2-3 trees, 2-3-4 trees.
In PS6 you will experiment with 2-3 trees.
