

# You Can Do More If You're Lazy!

*Handout #48*  
*CS251 Lecture 38*  
*May 8, 2007*

Franklyn Turbak  
Wellesley College

You Can Do More If You're Lazy, CS251 Spring '07 – p.1/2

## Overview of Today's Lecture

- A quick introduction to Haskell, a language with lazy parameter-passing and data structures.
- Modularity problems involving lists, and their solution with lazy lists in Haskell
- Lazy trees
- Lazy data in other languages

You Can Do More If You're Lazy, CS251 Spring '07 – p.2/2

# Sample Haskell Expressions

```
Prelude> 2*(3+4)
14
```

```
Prelude> head [1,2,3,4]
1
```

```
Prelude> tail [1,2,3,4]
[2,3,4]
```

```
Prelude> map (2*) [1,2,3,4]
[2,4,6,8]
```

```
Prelude> foldr (+) 0 [1,2,3,4]
10
```

```
Prelude> take 2 [10,20,30,40,50]
[10,20]
```

```
Prelude> drop 2 [10,20,30,40,50]
[30,40,50]
```

You Can Do More If You're Lazy, CS251 Spring '07 – p.3/2

# More Haskell Expressions

```
Prelude> fst (1,2)
1
```

```
Prelude> snd (1,2)
2
```

```
Prelude> zip [1,2,3] [10,20,30,40]
[(1,10),(2,20),(3,30)]
```

```
Prelude> unzip [(1,10),(2,20),(3,30)]
([1,2,3],[10,20,30])
```

```
Prelude> (\ x -> x*x) (1+2)
9
```

```
Prelude> (\ x y -> x*x) (1+2) (3/0) -- illustrates laziness
9
```

```
Prelude> (\ x y -> x*x) (3/0) (1+2)
Program error: primDivDouble 3.0 0.0
```

You Can Do More If You're Lazy, CS251 Spring '07 – p.4/2

# Haskell Types

```
Prelude> :type map
map :: (a -> b) -> [a] -> [b]

Prelude> :type foldr
foldr :: (a -> b -> b) -> b -> [a] -> bw2

Prelude> :type zip
zip :: [a] -> [b] -> [(a,b)]

Prelude> :type unzip
unzip :: [(a,b)] -> ([a],[b])

Prelude> :type "foo"
"foo" :: String

Prelude> :type "foo" == "bar"
"foo" == "bar" :: Bool
```

You Can Do More If You're Lazy, CS251 Spring '07 – p.5/2

# Qualified Types in Haskell

```
Prelude> :type 1+2
1 + 2 :: Num a => a

Prelude> :type [1,2,3]
[1,2,3] :: Num a => [a]

Prelude> :type 1 == 2
1 == 2 :: Num a => Bool

Prelude> :type \ x -> x*x
\ x -> x * x :: Num a => a -> a
```

You Can Do More If You're Lazy, CS251 Spring '07 – p.6/2

# Haskell Definitions

In HUGS, definitions *must* be in a file, not a top-level!

```
a = 2 + 3 -- declare variable a

sq = \ x -> x * x -- sugared form: sq x = x * x

fact 0 = 1 -- recursive factorial
fact n = n * fact (n-1)

factIter n = loop n 1 -- iterative factorial
  where loop 0 ans = ans
        loop num ans = loop (num-1) (num*ans)

isEven 0 = True -- Mutually recursive functions isEven and isOdd
isEven m = isOdd (m - 1)

isOdd 0 = False
isOdd n = isEven (n - 1)

mymap f [] = []
mymap f (x:xs) = (f x):(mymap f xs)
```

You Can Do More If You're Lazy, CS251 Spring '07 – p.7/2

## A Modularity Problem

Consider infinite sequences of integers, such as:

- *powers of 2*: 1, 2, 4, 8, 16, 32, 64, ...
- *factorials*: 1, 1, 2, 6, 24, 120, 720, ...
- *Fibonacci numbers*: 0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, ...
- *primes*: 2, 3, 5, 7, 11, 13, 17, 19, 23, 29 ...

Suppose we want answers to questions like the following:

- What are the first  $n$  elements?
- What is the first element greater than 100?
- What is the (0-based) index of the first element greater than 100?
- What is the first consecutive pair whose difference is more than 25?
- What is the least index  $i$  for which the sum of elements 0 through  $i$  is more than 1000?

**Challenge:** can we answer these questions in a modular way?

You Can Do More If You're Lazy, CS251 Spring '07 – p.8/2

# Non-Modular Haskell Solutions

```
-- returns list of first n Fibonacci numbers
fibsPrefix :: Integer -> [Integer]
fibsPrefix num = gen 0 0 1
  where gen n a b =
        if n >= num then []
        else a : (gen (n + 1) b (a + b))

-- returns least Fibonacci number greater than lim
leastFibGt :: Integer -> Integer
leastFibGt lim = least 0 1
  where least a b = if a > lim then a
                    else least b (a + b))

-- returns (0-based) index i such that first i Fibonacci
-- numbers have a sum greater than lim
fibSumIndex :: Integer -> Integer
fibSumIndex lim = index 0 0 0 1
  where index i sum a b =
        if sum > lim then i
        else index (i+1) (sum+a) b (a + b)
```

You Can Do More If You're Lazy, CS251 Spring '07 – p.9/2

## A More Modular Approach: Infinite Lists

*Idea:* Separate the generation of the sequence elements from subsequent processing. Since we don't know how many elements we need, generate *all* of them — *lazily!*

```
nats = genNats 0 where genNats n = n : genNats (n + 1)
-- Can also be written: nats = [0..]

poss = tail nats -- the positive integers
-- Can also be written: poss = [1..]

powers n = genPowers 1
  where genPowers x = x : (genPowers (n * x))

facts = genFacts 1 1
  where genFacts ans n = ans : (genFacts (n * ans) (n + 1))

fibs = genFibs 0 1
  where genFibs a b = a : (genFibs b (a + b))
```

You Can Do More If You're Lazy, CS251 Spring '07 – p.10/2

# Processing Infinite Lists

*Note:* Assume the following functions are invoked only on infinite lists. Then we can ignore the base case of an empty list! Each function could be extended to handle the empty list as well.

```
-- Returns a list of the first n elements of a given list.
-- (Note: the take function is part of standard Haskell)
take n (x:xs) = if (n == 0) then [] else x : (take (n-1) xs)

-- Returns first element satisfying predicate p
firstElem p (x:xs) = if (p x) then x else firstElem p xs

-- Returns first contiguous pair satisfying predicate p
firstPair p (x:y:zs) =
  if (p(x,y)) then (x,y) else firstPair p (y:zs)

-- Returns (0-based) index of first elt satisfying pred p
indexOf p xs = ind 0 xs
  where ind i (x:xs) =
    if (p x) then i else (ind (i+1) xs)
```

You Can Do More If You're Lazy, CS251 Spring '07 – p.11/2

## Modular Infinite List Processing Examples

```
take 10 fibs
```

```
firstElem (\ x -> x > 100) (powers 2)
```

```
indexOf (\ x -> x > 1000) facts
```

```
firstPair (\ (x,y) -> (y - x) > 25) fibs
```

You Can Do More If You're Lazy, CS251 Spring '07 – p.12/2

# Scanning

Scanning accumulates partial results of `foldl` into a list.

```
scanl :: (a -> b -> a) -> a -> [b] -> [a]
scanl f ans (x:xs) = ans : scanl f (f ans x) xs

scanl (+) 0 (powers 2) -- be careful of initial zero!

-- alternative definition of facts
facts = scanl (*) 1 poss

-- Like scanl, but uses first elt as initial answer
scanl1 :: (a -> a -> a) -> [a] -> [a]
scanl1 f (x:xs) = scanl f x xs

indexOf (\ s -> s > 1000) (scanl1 (+) fibs)
```

You Can Do More If You're Lazy, CS251 Spring '07 - p.13/2

# Higher-order Infinite List Generation

```
iterate :: (a -> a) -> a -> [a]
iterate f x = x : iterate f (f x)

-- another way to generate the nats
nats = iterate (1 +) 0

iterate2 :: (a -> a -> a) -> a -> a -> [a]
iterate2 f x1 x2 = x1 : iterate2 f x2 (f x1 x2)

-- another way to generate the fibs
fibs = iterate2 (+) 0 1

iteratei :: (Integer -> a -> a) -> Integer -> a -> [a]
iteratei f i x = x : iteratei f (i + 1) (f i x)

-- yet another way to generate the facts
facts = iteratei (*) 1 1
```

You Can Do More If You're Lazy, CS251 Spring '07 - p.14/2

# Cyclic Definitions of Infinite Lists

```
ones = 1 : ones

-- cyclic definition of nats
nats = 0 : (map (1 +) nats)

zipWith :: (a -> b -> c) -> [a] -> [b] -> [c]
zipWith f (x:xs) (y:ys) = (f x y) : (zipWith f xs ys)

-- another cyclic definition of nats
nats = 0 : (zipWith (+) ones nats)

-- cyclic definition of facts
facts = 1 : (zipWith (*) poss facts)

-- cyclic definition of fibs
fibs = 0 : 1 : (zipWith (+) fibs (tail fibs))
```

You Can Do More If You're Lazy, CS251 Spring '07 – p.15/2

# Generating Primes

*Idea:* use the Sieve of Eratosthenes

```
sieve (x:xs) =
  x : (sieve (filter (\ y -> (rem y x) /= 0) xs))

primes = sieve (tail (tail nats))
  -- start sieving at 2
```

Not only does this give an infinite list of primes, it does so efficiently by avoiding unnecessary divisions .

For more examples of lazy lists in Haskell , see Chapter 17 of Simon Thompson book *Haskell : The Craft of Functional Programming*.

You Can Do More If You're Lazy, CS251 Spring '07 – p.16/2

# Lazy Trees

Can use laziness to perform a two-pass tree walk in a single pass:

```
data Tree a = Leaf | Node (Tree a) a (Tree a) deriving Show
```

```
addMax tr = tr'
```

```
  where (tr', m) = walk tr
```

```
        walk Leaf = (Leaf, 0)
```

```
        walk (Node l n r) = (Node l' (n + m) r', max3 n ml mr)
```

```
          where (l',ml) = walk l
```

```
                (r',mr) = walk r
```

```
max3 a b c = max a (max b c)
```

```
t = (Node (Node Leaf 1 (Node Leaf 7 Leaf)) 5 (Node Leaf 4 Leaf))
```

```
-- AddMax> addMax t
```

```
-- Node (Node Leaf 8 (Node Leaf 14 Leaf)) 12 (Node Leaf 11 Leaf)
```

See Hughes paper *Functional Programming Matters* for compelling lazy game tree example.

You Can Do More If You're Lazy, CS251 Spring '07 – p.17/2

## Streams: Lazy Lists for Scheme and Hoilec

Scheme Lists	Scheme Streams	Hoilec Lists	Hoilec Streams
cons	cons-stream	prep	sprep
car	head	head	shead
cdr	tail	tail	stail
'()	the-empty-stream	#e	(sempty)
null?	null-stream	empty?	sempty?

Note: Scheme and Hoilec streams are lazy only in their tails, *not* in their heads!

You Can Do More If You're Lazy, CS251 Spring '07 – p.18/2

# Hoilec Streams

`(sprep  $E_{head}$   $E_{tail}$ )` returns a (potentially infinite) stream whose head is the value of  $E_{head}$  and whose tail is the value of  $E_{tail}$ . The evaluation of  $E_{tail}$  is delayed until it is needed.

`(shead  $E_{stream}$ )` returns the head element of the stream value of  $E_{stream}$ .

`(stail  $E_{stream}$ )` returns the tail element of the stream value of  $E_{stream}$ . This forces the computation of the delayed tail expression.

`sempty` returns the empty stream.

`(sempty?  $E_{stream}$ )` returns `#t` if  $E_{stream}$  is the empty stream and `#f` otherwise.

You Can Do More If You're Lazy, CS251 Spring '07 – p.19/2

## Hoilec Stream Examples I

```
;; Generate stream of integers starting with n
(def ints-from
  (fun (n)
    (sprep (ints-from (+ n 1))))) ; No base case!

;; Converts first n elements of infinite stream to a list
(def (sprefix n stream)
  (if (= n 0)
    #e
    (prep (shead stream)
          (sprefix (- n 1) (stail stream)))))

(def ones (sprep 1 ones))

(def (smap f stream)
  (if (sempty? stream)
    stream
    (sprep (f (shead stream)) (smap f (stail stream)))))

(def nats (sprep 0 (smap (fun (x) (+ x 1)) nats)))
```

You Can Do More If You're Lazy, CS251 Spring '07 – p.20/2

# Scheme Stream Examples II

```
(def smap2
  (fun (f str1 str2)
    (sprep (f (shead str1) (shead str2))
           (smap2 f (stail str1) (stail str2))))))

(def fibs
  (sprep 0
        (sprep 1
              (smap2 (fun (x y) (+ x y))
                    fibs
                    (stail fibs))))))
```

Can similarly translate other lazy list examples from Haskell to Hoilec and Scheme

See Section 3.5 of *Structure and Interpretation of Computer Programs (SICP)* for more Scheme stream examples.

You Can Do More If You're Lazy, CS251 Spring '07 – p.21/2

## Implementing Lazy Data in Strict Languages

- Use memoizing promises to implement lazy lists in Hoilec:

```
(delay E) desugars to (make-promise (fun () E))

(def (force promise) (promise))

(sprep E1 E2) desugars to (list E1 (delay E2))

(define (shead stream) (nth 1 stream))

(define (stail stream) (force (nth 2 stream)))

(define (empty) #e)

(define (empty? stream) (empty? stream))
```

- Can generalize this idea to handle infinite trees.
- Can similarly implement lazy lists in OCaml.
- Lazy data is very helpful, but sometimes need even more laziness (e.g. translating `addMax` example to Scheme or OCaml).

You Can Do More If You're Lazy, CS251 Spring '07 – p.22/2

# Java Iterators

Like streams, Java's iterators can be conceptually infinite. For example:

```
public class FibIterator implements Iterator<Integer> {  
  
    private int a, b;  
  
    public FibIterator () { a = 0; b = 1; }  
  
    public boolean hasNext () { return true; }  
  
    public Integer next () {  
        int old_a = a; a = b; b = old_a + b;  
        return new Integer(old_a);} // wrap int to satisfy next() spec  
  
    public void remove () { ... ignore this ... }  
}
```

- Unlike streams, enumerations are not *persistent*; can't hold on to a snapshot of the enumeration at a given point in time without copying it.
- While lazy lists are easy to adapt to trees, enumerations are inherently linear.
