

Functions in Racket

CS251 Programming Languages

Spring 2017, Lyn Turbak

Department of Computer Science
Wellesley College

lambda denotes a anonymous function

Syntax: `(lambda (Id1 ... Idn) Ebody)`

- `lambda`: keyword that introduces an anonymous function (the function itself has no name, but you're welcome to name it using `define`)
- `Id1 ... Idn`: any identifiers, known as the **parameters** of the function.
- `Ebody`: any expression, known as the **body** of the function.
It typically (but not always) uses the function parameters.

Evaluation rule:

- A lambda expression is just a value (like a number or boolean), so a lambda expression evaluates to itself!
- What about the function body expression? That's not evaluated until later, when the function is **called**. (Synonyms for **called** are **applied** and **invoked**.)

Functions 3

Racket Functions

Functions: most important building block in Racket (and 251)

- Functions/procedures/methods/subroutines abstract over computations
- Like Java methods, Python functions have arguments and result
- But no classes, `this`, `return`, etc.

Examples:

```
(define dbl (lambda (x) (* x 2)))  
  
(define quad (lambda (x) (dbl (dbl x))))  
  
(define avg (lambda (a b) (/ (+ a b) 2)))  
  
(define sqr (lambda (n) (* n n)))  
  
(define n 10)  
  
(define small? (lambda (num) (≤ num n)))
```

Functions 2

Function applications (calls, invocations)

To use a function, you **apply** it to arguments (**call** it on arguments).

E.g. in Racket: `(dbl 3)`, `(avg 8 12)`, `(small? 17)`

Syntax: `(E0 E1 ... En)`

- A function application expression has no keyword. It is the only parenthesized expression that **doesn't** begin with a keyword.
- `E0`: any expression, known as the **rator** of the function call (i.e., the function position).
- `E1 ... En`: any expressions, known as the **rands** of the call (i.e., the argument positions).

Evaluation rule:

1. Evaluate `E0 ... En` in the current environment to values `V0 ... Vn`.
2. If `V0` is not a lambda expression, raise an error.
3. If `V0` is a lambda expression, returned the result of applying it to the argument values `V1 ... Vn` (see following slides).

Functions 4

Function application

What does it mean to apply a function value (lambda expression) to argument values? E.g.

```
(lambda (x) (* x 2)) 3  
(lambda (a b) (/ (+ a b) 2) 8 12)
```

We will explain function application using two models:

1. The **substitution model**: substitute the argument values for the parameter names in the function body.
This lecture
2. The **environment model**: extend the environment of the function with bindings of the parameter names to the argument values.
Later

Functions 5

Substitution notation

We will use the notation

$E[V_1, \dots, V_n / I_d_1, \dots, I_d_n]$

to indicate the expression that results from substituting the values V_1, \dots, V_n for the identifiers I_d_1, \dots, I_d_n in the expression E .

For example:

- $(\ast x 2)[3/x]$ stands for $(\ast 3 2)$
- $(/ (+ a b) 2)[8,12/a,b]$ stands for $(/ (+ 8 12) 2)$
- $(\text{if } (< x z) (+ (\ast x x) (\ast y y)) (/ x y)) [3,4/x,y]$
stands for $(\text{if } (< 3 z) (+ (\ast 3 3) (\ast 4 4)) (/ 3 4))$

It turns out that there are some very tricky aspects to doing substitution correctly. We'll talk about these when we encounter them.

Functions 7

Function application: substitution model

Example 1:

```
(lambda (x) (* x 2)) 3  
↓ Substitute 3 for x in (* x 2)  
(* 3 2)
```

Now evaluate $(\ast 3 2)$ to 6

Example 2:

```
(lambda (a b) (/ (+ a b) 2) 8 12)  
↓ Substitute 8 for a and 12 for b  
in (/ (+ a b) 2)  
(/ (+ 8 12) 2)
```

Now evaluate $(/ (+ 8 12) 2)$ to 10

Functions 6

Avoid this common substitution bug

Students sometimes **incorrectly** substitute the argument values into the parameter positions:

Makes no sense

```
(lambda (a b) (/ (+ a b) 2) 8 12)  
↓  
(lambda (8 12) (/ (+ 8 12) 2))
```

When substituting argument values for parameters, **only the modified body should remain. The lambda and params disappear!**

```
(lambda (a b) (/ (+ a b) 2) 8 12)  
↓  
(/ (+ 8 12) 2)
```

Functions 8

Small-step function application rule: substitution model

```
( lambda (Id1 ... Idn) Ebody) V1 ... Vn )  
⇒ Ebody[V1 ... Vn/Id1 ... Idn] [function call (a.k.a.apply)]
```

Note: could extend this with notion of “current environment”

Functions 9

Small-step semantics: function example

```
(quad 3)  
⇒ ((lambda (x) (dbl (dbl x))) 3) [varref]  
⇒ (dbl (dbl 3)) [function call]  
⇒ ((lambda (x) (* x 2)) (dbl 3)) [varref]  
⇒ ((lambda (x) (* x 2))  
    ((lambda (x) (* x 2)) 3)) [varref]  
⇒ ((lambda (x) (* x 2)) (* 3 2)) [function call]  
⇒ ((lambda (x) (* x 2)) 6) [multiplication]  
⇒ (* 6 2) [function call]  
⇒ 12 [multiplication]
```

Functions 10

Small-step substitution model semantics: your turn

Suppose **env3** = $n \rightarrow 10$,
 $\text{small?} \rightarrow (\lambda(\text{num}) (\leq \text{num } n))$,
 $\text{sqr} \rightarrow (\lambda(n) (* n n))$

Give an evaluation derivation for $(\text{small? } (\text{sqr } n)) \# \text{env3}$

Functions 11

Stepping back: name issues

Do the particular choices of function parameter names matter?

Is there any confusion caused by the fact that `dbl` and `quad` both use `x` as a parameter?

Are there any parameter names that we can't change `x` to in `quad`?

In $(\text{small? } (\text{sqr } n))$, is there any confusion between the global parameter name `n` and parameter `n` in `sqr`?

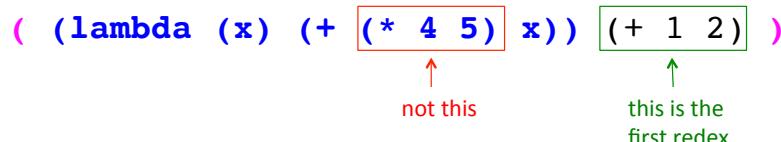

Is there any parameter name we can't use instead of `num` in `small?`

Functions 12

Evaluation Contexts

Although we will not do so here, it is possible to formalize exactly how to find the next redex in an expression using so-called **evaluation contexts**.

For example, in Racket, we never try to reduce an expression within the body of a lambda.

We'll see later in the course that other choices are possible (and sensible).

Functions 13

Big step function call rule: substitution model

$E_0 \# \text{env} \downarrow (\lambda (Id_1 \dots Id_n) E_{body})$

$E_1 \# \text{env} \downarrow V_1$

\vdots

$E_n \# \text{env} \downarrow V_n$

$E_{body}[V_1 \dots V_n / Id_1 \dots Id_n] \# \text{env} \downarrow V_{body}$ (function call)

$(E_0 E_1 \dots E_n) \# \text{env} \downarrow V_{body}$

Functions 14

Note: no need for function application frames like those you've seen in Python, Java, C, ...

Substitution model derivation

Suppose $\text{env2} = \text{dbl1} \rightarrow (\lambda (x) (* x 2)),$
 $\text{quad} \rightarrow (\lambda (x) (\text{dbl1} (\text{dbl1} x)))$

A diagram showing the derivation of $\text{quad} \# \text{env2} \downarrow$. It starts with $\text{quad} \# \text{env2} \downarrow (\lambda (x) (\text{dbl1} (\text{dbl1} x)))$. This reduces to $3 \# \text{env2} \downarrow 3$. Then, $3 \# \text{env2} \downarrow 3$ reduces to $\text{dbl1} \# \text{env2} \downarrow (\lambda (x) (* x 2))$. This reduces to $\text{dbl1} \# \text{env2} \downarrow (\lambda (x) (* x 2))$. Then, $\text{dbl1} \# \text{env2} \downarrow (\lambda (x) (* x 2))$ reduces to $3 \# \text{env2} \downarrow 3$. Finally, $3 \# \text{env2} \downarrow 3$ reduces to $(*) 3 2 \# \text{env2} \downarrow 6$ [multiplication rule, subparts omitted]. A bracket labeled "[function call]" points to the reduction of $(*) 3 2 \# \text{env2} \downarrow 6$. This leads to $(\text{dbl1} 3) \# \text{env2} \downarrow 6$. Another bracket labeled "[function call]" points to the reduction of $(\text{dbl1} 3) \# \text{env2} \downarrow 6$. This leads to $(*) 6 2 \# \text{env2} \downarrow 12$ [multiplication rule, subparts omitted]. A bracket labeled "(function call)" points to the reduction of $(*) 6 2 \# \text{env2} \downarrow 12$. This leads to $(\text{dbl1} (\text{dbl1} 3)) \# \text{env2} \downarrow 12$. A bracket labeled "(function call)" points to the reduction of $(\text{dbl1} (\text{dbl1} 3)) \# \text{env2} \downarrow 12$. Finally, this leads to $(\text{quad} 3) \# \text{env2} \downarrow 12$.

Functions 15

Recursion

Recursion works as expected in Racket using the substitution model (both in big-step and small-step semantics).

There is no need for any special rules involving recursion! The existing rules for definitions, functions, and conditionals explain everything.

```
(define fact
  (lambda (n)
    (if (= n 0)
        1
        (* n (fact (- n 1))))))
```

What is the value of `(fact 3)`?

Functions 16

Small-step recursion derivation for (fact 4) [1]

Let's use the abbreviation `λ_fact` for the expression

```
(λ (n) (if (= n 0) 1 (* n (fact (- n 1)))))  
{fact} 4  
⇒ {(λ_fact 4)}  
⇒ (if { (= 4 0)} 1 (* 4 (fact (- 4 1))))  
⇒ {(if #f 1 (* 4 (fact (- 4 1))))}  
⇒ (* 4 ({fact} (- 4 1)))  
⇒ (* 4 (λ_fact {(- 4 1)}))  
⇒ (* 4 {(λ_fact 3)})  
⇒ (* 4 (if { (= 3 0)} 1 (* 3 (fact (- 3 1)))))  
⇒ (* 4 {(if #f 1 (* 3 (fact (- 3 1))))})  
⇒ (* 4 (* 3 ({fact} (- 3 1))))  
⇒ (* 4 (* 3 (λ_fact {(- 3 1)})))  
⇒ (* 4 (* 3 {(λ_fact 2)}))  
⇒ (* 4 (* 3 (if { (= 2 0)} 1 (* 2 (fact (- 2 1)))))  
⇒ (* 4 (* 3 {(if #f 1 (* 2 (fact (- 2 1))))}))  
... continued on next slide ...
```

Functions 17

Abbreviating derivations with \Rightarrow^*

$E_1 \Rightarrow^* E_2$ means E_1 reduces to E_2 in zero or more steps

```
{fact} 4  
⇒ {(λ_fact 4)}  
⇒* (* 4 {(λ_fact 3)})  
⇒* (* 4 (* 3 {(λ_fact 2)}))  
⇒* (* 4 (* 3 (* 2 {({λ_fact 1)}))))  
⇒* (* 4 (* 3 (* 2 (* 1 {({λ_fact 0)})))))  
⇒* (* 4 (* 3 (* 2 {(* 1 1)})))  
⇒ (* 4 (* 3 {(* 2 1)}))  
⇒ (* 4 {(* 3 2)})  
⇒ {(* 4 6)}  
⇒ 24
```

Functions 19

Small-step recursion derivation for (fact 4) [2]

... continued from previous slide ...
⇒ (* 4 (* 3 (* 2 {({fact} (- 2 1)}))))
⇒ (* 4 (* 3 (* 2 {({λ_fact} (- 2 1)}))))
⇒ (* 4 (* 3 (* 2 {({λ_fact 1)}))))
⇒ (* 4 (* 3 (* 2 {({λ_fact 1)}))))
⇒ (* 4 (* 3 (* 2 {({if} { (= 1 0)} 1 (* 1 (fact (- 1 1))))}))
⇒ (* 4 (* 3 (* 2 {({if} #f 1 (* 1 (fact (- 1 1))))}))
⇒ (* 4 (* 3 (* 2 {(* 1 {({fact} (- 1 1)}))))))
⇒ (* 4 (* 3 (* 2 {(* 1 {({λ_fact} (- 1 1)}))))))
⇒ (* 4 (* 3 (* 2 {(* 1 {({λ_fact 0)}))))))
⇒ (* 4 (* 3 (* 2 {(* 1 {({if} { (= 0 0)} 1 (* 0 (fact (- 0 1))))}))))
⇒ (* 4 (* 3 (* 2 {(* 1 {({if} #t 1 (* 0 (fact (- 0 1))))}))))
⇒ (* 4 (* 3 (* 2 {(* 1 1)})))
⇒ (* 4 {(* 3 2)})
⇒ {(* 4 6)}
⇒ 24

Functions 18

Recursion: your turn

Show an **abbreviated** small-step evaluation of `(pow 5 3)` where `pow` is defined as:

```
define pow  
  (lambda (base exp)  
    (if (= exp 0)  
        1  
        (* base (pow base (- exp 1))))))
```

How many multiplications are performed in
`(pow 2 10)`?
`(pow 2 100)`?
`(pow 2 1000)`?

What is the **stack depth** (# pending multiplies) in these cases?

Functions 20

Recursion: your turn 2

Show an **abbreviated** small-step evaluation of (`fast-pow 2 10`) with the following definitions :

```
(define square (lambda (n) (* n n)))
(define even? (lambda (n) (= 0 (remainder n 2))))
(define fast-pow
  (lambda (base exp)
    (if (= exp 0)
        1
        (if (even? exp)
            (fast-pow (square base) (/ exp 2))
            (* base (fast-pow base (- exp 1)))))))
```

How many multiplications are performed in

(`pow 2 10`)?
(`pow 2 100`)?
(`pow 2 1000`)?

What is the **stack depth** (# pending multiplies) in these cases?

Functions 21

Tree Recursion: fibonacci

Suppose the global env contains binding `fib ↪ λ_fib`, where `λ_fib` abbreviates
($\lambda (n) (\text{if } (\leq n 1) n (+ (\text{fib} (- n 1)) (\text{fib} (- n 2))))$)

```
{fib} 4
⇒ {(\lambda_fib 4)}
⇒* (+ {(\lambda_fib 3)} (fib (- 4 2)))
⇒* (+ (+ {(\lambda_fib 2)} (fib (- 3 2))) (fib (- 4 2)))
⇒* (+ (+ (+ {(\lambda_fib 1)} (fib (- 2 2))) (fib (- 3 2))) (fib (- 4 2)))
⇒* (+ (+ (+ 1 {(\lambda_fib 0)})) (fib (- 3 2))) (fib (- 4 2)))
⇒* (+ (+ {(+ 1 0)}) (fib (- 3 2))) (fib (- 4 2)))
⇒* (+ (+ 1 {(\lambda_fib 1)})) (fib (- 4 2)))
⇒* (+ {(+ 1 1)}) (fib (- 4 2))
⇒* (+ 2 {(\lambda_fib 2)})
⇒* (+ 2 (+ {(\lambda_fib 1)} (fib (- 2 2))))
⇒* (+ 2 (+ 1 {(\lambda_fib 0)}))
⇒* (+ 2 {(+ 1 0)})
⇒ {(+ 2 1)}
⇒ 3
```

Functions 22

Syntactic sugar: function definitions

Syntactic sugar: simpler syntax for common pattern.

- Implemented via textual translation to existing features.
- *i.e., not a new feature.*

Example: Alternative function definition syntax in Racket:

```
(define (Id_funName Id1 ... Idn) E_body)
desugars to

(define Id_funName (lambda (Id1 ... Idn) E_body))

(define (dbl x) (* x 2))
(define (quad x) (dbl (dbl x)))

(define (pow base exp)
  (if (< exp 1)
      1
      (* base (pow base (- exp 1)))))
```

Functions 23

Racket Operators are Actually Functions!

Surprise! In Racket, operations like (`+ e1 e2`),
(`< e1 e2`) and (`not e`) are really just function calls!

There is an initial top-level environment that contains bindings for built-in functions like:

- `+` → *addition function*,
- `-` → *subtraction function*,
- `*` → *multiplication function*,
- `<` → *less-than function*,
- `not` → *boolean negation function*,
- ...

(where some built-in functions can do special primitive things that regular users normally can't do --- e.g. add two numbers)

Functions 24

Summary So Far

Racket declarations:

- definitions: (define *Id E*)

Racket expressions:

- conditionals: (if *Etest Ethen Eelse*)
- function values: (lambda (*Id1 ... Idn*) *Ebody*)
- Function calls: (*Erator Erand1 ... Erandn*)
Note: arithmetic and relation operations are just function calls

What about?

- Assignment? Don't need it!
- Loops? Don't need them! Use **tail recursion**, coming soon.
- Data structures? Glue together two values with `cons` (next time)
