Introduction To Standard ML

CS251 Programming Languages Spring 2017 Lyn Turbak, Meera Hejmadi, Mary Ruth Ngo, & Angela Wu

Department of Computer Science Wellesley College

The ML Programming Language

ML (Meta Language) was developed by Robin Milner in 1975 for specifying theorem provers. It since has evolved into a general purpose programming language.

Important features of ML:

- static typing: catches type errors at compile-time.
- type reconstruction: infers types so programmers don't have to write them explicitly
- polymorphism: functions and values can be parameterized over types (think Java generics, but much better).
- function-oriented (functional): encourages a composition-based style of programming and first-class functions
- sum-of-products dataypes with pattern-matching: simplifies the manipulation of tree-structured data

These features make ML an excellent language for mathematical calculation, data structure implementation, and programming language implementation.

Introduction to Standard ML 2

ML Dialects

There are several different dialects of ML. The two we use at Wellesley are:

• Standard ML (SML): Version developed at AT&T Bell Labs. We'll use this in CS251. The particular implementation we'll use is Standard ML of New Jersey (SMLNJ):

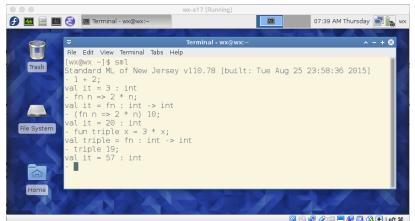

http://www.smlnj.org/

 Objective CAML: Version developed at INRIA (France). We have sometimes used this in other Wellesley courses.

These dialects differ in minor ways (e.g., syntactic conventions, library functions). See the following for a comparison:

http://www.mni-sws.mng.de/~rossherg/sml-vs-ocaml.html

SML and wx

We will use SML inside the wx Virtual Machine appliance. Details on how to install wx and SML within wx will be supplied.

For initial examples, it's easiest to run SML in a terminal window, as shown above. But we'll soon see (slides 18 – 19) running it in Emacs is **much** better!

Learning SML by Interactive Examples

Try out these examples. (Note: many answers are missing in these slides so you can predict them. See the solns slides for answers.

```
[wx@wx ~] sml
Standard ML of New Jersey v110.78 [built: Wed Jan 14 12:52:09 2015]
- 1 + 2;
val it = 3 : int
- 3+4;
val it = 7 : int
- 5+6
= ;
val it = 11 : int
- 7
= +
= 8;
val it = 15 : int
```

Introduction to Standard ML 5

Naming Values

```
- val a = 2 + 3;
val a = : int

- a * a;
val it = : int

- it + a;
val it = : int
```

Introduction to Standard ML 6

Introduction to Standard ML 8

Negative Quirks

```
- 2 - 5;
val it = \sim 3 : int
-17;
stdIn:60.1 Error: expression or pattern begins with infix
identifier "-"
stdIn:60.1-60.4 Error: operator and operand don't agree
[literal]
  operator domain: 'Z * 'Z
  operand:
                  int
 in expression:
   - 17
- ~17;
val it = \sim 17 : int
- 3 * ~1;
val it = \sim 3 : int
```

Introduction to Standard ML 7

Division Quirks

Simple Functions

```
- val inc = fn x => x + 1;
val inc = fn : int -> int (* SML figures out type! *)
- inc a;
val it = : int
- fun dbl y = y * 2;
  (* Syntactic sugar for val dbl = fn y => y * 2 *)
val dbl = fn : int -> int
- dbl 5;
val it = : int
- (fn x => x * 3) 10; (* Don't need to name function to use it *)
val it = : int
```

Introduction to Standard ML 9

When Parentheses Matter

```
- dbl(5); (* parens are optional here *)
val it = 10 : int
- (dbl 5); (* parens are optional here *)
val it = 10 : int
- inc (dbl 5); (* parens for argument subexpressions are required! *)
val it = 11 : int
- (inc dbl) 5;
stdIn:1.2-2.2 Error: operator and operand don't agree [tycon mismatch]
  operator domain: int
  operand:
                  int -> int
 in expression:
   inc dbl
- inc dbl 5; (* default left associativity for application *)
stdIn:22.1-22.10 Error: operator and operand don't agree [tycon
mismatch]
  operator domain: int
                 int -> int
  operand:
  in expression:
   inc dbl
```

Introduction to Standard ML 10

Booleans

```
-1 = 1:
val it =
           : bool
-1 > 2;
val it =
             : bool
- (1 = 1) andalso (1 > 2);
val it =
          : bool
-(1 = 1) orelse (1 = 2);
val it = : bool
-(3=4) and also (5=(6 \text{ div } 0)); (* short-circuit evaluation *)
val it = : bool
- fun isEven n = (n \mod 2) = 0;
val isEven = fn : int -> bool (* SML figures out type! *)
- isEven 17;
val it =
              : bool
- isEven 6;
val it =
           : bool
                                                Introduction to Standard ML 11
```

Conditionals

```
- fun f n = if n > 10 then 2 * n else n * n;
val f = fn : int -> int
- f 20;
val it = : int
- f 5;
val it = : int
```

Recursion

```
- fun fact n =
  if n = 0 then
  else
     n * (fact (n - 1)); (* fun names have recursive scope *)
val fact = fn : int -> int
  (* simpler than Java definition b/c no explicit types! *)
- fact 5;
val it =
          : int
- fact 12;
val it =
                 : int
- fact 13;
uncaught exception Overflow [overflow]
 raised at: <file stdIn>
  (* SML ints have limited size ⊗ *)
```

Introduction to Standard ML 13

Easier to Put Your Code in a File

- File is a sequence of value/function definitions.
- Definitions are **not** followed by semi-colons in files!
- There are no continuation characters (equal signs) for multiple-line definitions.

- Introduction to Standard ML 14

Using Code From a File

```
- Posix.FileSys.getcwd(); (* current working directory *)
val it = "/students/gdome" : string
- Posix.FileSys.chdir("/students/gdome/cs251/sml");
  (* change working directory *)
val it = () : unit
- Posix.FileSys.getcwd();
val it = "/students/gdome/cs251/sml" : string
- use "mydefns.sml"; (* load defns from file as if *)
[opening mydefns.sml] (* they were typed manually *)
val a = 5 : int
val b = 10 : int
val sq = fn : int -> int
val hyp = fn : int -> int -> real
val fact = fn : int -> intval
it = () : unit
- fact a
val it = 120 : int
                                              Introduction to Standard ML 15
```

Another File Example

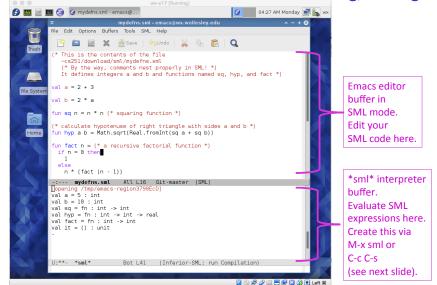

```
(* This is the contents of the file test-fact.sml *)
val fact_3 = fact 3
val fact_a = fact a

- use "test-fact.sml";
[opening test-fact.sml]
val fact_3 = 6 : int
val fact_a = 120 : int
val it = () : unit
```

Nested File Uses

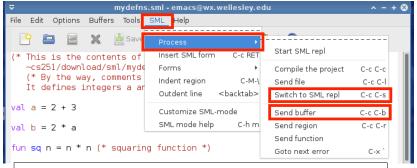

```
(* The contents of the file load-fact.sml *)
use "mydefns.sml"; (* semi-colons are required here *)
use "test-fact.sml";
- use "load-fact.sml";
[opening load-fact.sml]
[opening mydefns.sml]
val a = 5 : int
val b = 10 : int
val sq = fn : int -> int
val hyp = fn : int -> int -> real
val fact = fn : int -> intval
[opening test-fact.sml]
val fact 3 = 6: int
val fact a = 120: int
val it = () : unit
val it = () : unit.
                                             Introduction to Standard ML 17
```

Use Emacs within wx for all your SML editing/testing

Introduction to Standard ML 18

Use Emacs SML commands to start *sml* interpreter buffer and send editor buffer contents to it

SML>Process>Switch to SML repl (or C-c C-s) creates the *sml* interpreter buffer. This is just like the SML interpreter buffer in a terminal window, but it's in an Emacs buffer.

SML>Process>Send buffer (or C-c C-b) sends the contents of the SML editor buffer to the *sml* buffer. This is much more convenient than use for loading the contents of a file into the *sml* buffer.

Introduction to Standard ML 19

How to exit SML interpreter?

Your turn: fib

In an Emacs buffer, translate the following recursive Racket function into iSML, and then test your SML fib function in the *sml* interpreter buffer.

Introduction to Standard ML 21

Introduction to Standard ML 23

Strings

```
- "foobar";
val it =
               : string
- "foo" ^ "bar" ^ "baz";
val it =
                 : string
- print ("baz" ^ "quux");
bazquuxval it = () : unit
- print ("baz" ^ "quux\n"); (* parens are essential here! *)
val it = () : unit
- print "baz" ^ "quux\n";
stdIn:1.1-1.23 Error: operator and operand don't agree
[tycon mismatch]
  operator domain: string * string
  operand: unit * string
  in expression:
   print "baz" ^ "quux\n"
```

Introduction to Standard ML 22

Introduction to Standard ML 24

Other String Operations

```
- String.size ("foo" ^ "bar");
val it = : int
- String.substring ("abcdefg", 2, 3); (* string, start index, len *)
val it = : string
("bar" < "foo", "bar" <= "foo", "bar" = "foo", "bar" > "foo");
-(String.compare("bar", "foo"), String.compare("foo", "foo"),
= String.compare("foo", "bar"));
val it = (   ,   ,   ) : order * order * order
- String.size;
val it = fn : string -> int
- String.substring;
val it = fn : string * int * int -> string
- String.compare;
val it = fn : string * string -> order
(* An API for all SMLNJ String operations can be found at:
http://www.standardml.org/Basis/string.html *)
```

Characters

```
- #"a";
val it = #"a" : char
- String.sub ("foobar",0);
val it = : char
- String.sub ("foobar",5);
val it = : char
- String.sub ("foobar",6);
uncaught exception Subscript [subscript out of bounds]
 raised at: stdIn:17.1-17.11
- String.str #"a"; (* convert a char to a string *)
val it = "a" : string
- (String.str (String.sub ("ABCD",2))) ^ "S"
= ^ (Int.toString (112 + 123));
val it = : string
- (1+2, 3=4, "foo" ^ "bar", String.sub("baz",2));
```

Tuples

```
- val tpl = (1 + 2, 3 < 4, 5 * 6, 7 = 8);
val tpl = (3,true,30,false) : int * bool * int * bool
- #1 tpl;
val it = 3: int
- #2 tpl;
val it = true : bool

(* In practice, *always* use pattern matching
    (see later slides) rather than #1, #2, etc. *)
- ((#1 tpl) + (#3 tpl), (#2 tpl) orelse (#4 tpl));
val it = (33,true) : int * bool</pre>
```

Introduction to Standard ML 25

Pattern-matching Tuple Function Arguments

```
- fun swap (x,y) = (y, x);
val swap = fn : 'a * 'b -> 'b * 'a
(* infers polymorphic type!
    'a and 'b stand for any two types. *)

- swap (1+2, 3=4);
val it = (false,3) : bool * int

- swap (swap (1+2, 3=4));
val it = (3, false) : int * bool

- swap ((1+2, 3=4), ("foo" ^ "bar", String.sub("baz",2)));
val it = (("foobar", #"z"), (3, false)) : (string * char) *
(int * bool)
```

Introduction to Standard ML 26

How to Pass Multiple Arguments

```
- fun avgl (x, y) = (x + y) div 2; (* Approach 1: use pairs *)
val avg1 = fn : int * int -> int
- avg1 (10,20);
val it = 15 : int
- fun avg2 x = (fn y => (x + y) div 2); (* Approach 2: currying *)
val avg2 = fn : int -> int -> int
- avg2 10 20;
val it = 15 : int
- fun avg3 x y = (x + y) div 2; (* Syntactic sugar for currying *)
val avg3 = fn : int -> int -> int
- avg3 10 20;
val it = 15 : int
- app5 (avg3 15);
val it = 10 : int
- app5 (fn i => avg1(15,i));
val it = 10 : int
                                                    Introduction to Standard ML 27
```

Functions as Arguments

```
- fun app5 f = f 5;
val app5 = fn : (int -> 'a) -> 'a
(* infers polymorphic type!
    'a stands for "any type" *)
- app5 (fn x => x + 1);
val it = 6 : int
- fun dbl y = 2*y;
val dbl = fn : int -> int
- app5 dbl;
val it = 10 : int
```

We'll see later that functions can also be returned as results from other functions and stored in data structures, so functions are first-class in SML just as in Racket.

Your turn: translate these from Racket to SMI

Introduction to Standard ML 29

Function Composition

```
- val inc x = x + 1;
val inc = fn : int -> int
- fun dbl v = v * 2;
val dbl = fn : int -> int
- (inc o dbl) 10; (* SML builtin infix function composition *)
val it = 21 : int
- (dbl o inc) 10;
val it = 22: int
- fun id x = x; (* we can define our own identity fcn *)
val id = fn : 'a -> 'a (* polymorphic type; compare to
 Java's public static <T> T id (T x) {return x;} *)
- (inc o id) 10;
val it = 11 : int
- (id o dbl) 10;
val it = 20 : int
- (inc o inc o inc o inc) 10;
val it = 14: int.
                                                   Introduction to Standard ML 30
```

Iterating via Tail Recursion

```
- use ("step.sml");
[opening step.sml]
val step = fn : int * int -> int * int
val stepUntil = fn : (int * int) * int -> int * int
val it = () : unit
- step (1,2);
val it = (3,2) : int * int
- step (step (1,2));
val it = (5,6) : int * int
- let val (x,y) = step (step (1,2)) in x*y end;
val it = 30 : int
- stepUntil ((1,2), 100);
val it = (371,13530) : int * int
```

Introduction to Standard ML 31

Adding print statements

```
- use ("step-more.sml");
[opening step-more.sml]
val printPair = fn : int * int -> unit
val stepUntilPrint = fn : (int * int) * int -> int * int
val it = () : unit

- stepUntilPrint ((1,2),100);
(1,2)
(3,2)
(5,6)
(11,30)
(41,330)
val it = (371,13530) : int * int
```

Gotcha! Scope of Top-Level Names

```
- val a = 2 + 3;
val a = 5 : int
- val b = a * 2;
val b = 10 : int.
- fun adda x = x + a; (* adda adds 5 *)
val adda = fn : int -> int
- adda 7;
val it = 12 : int
- adda b:
val it = 15 : int
- val a = 42; (* this is a different a from the previous one *)
val a = 42 : int
- b; (* ML values are immutable; nothing can change b's value *)
val it = 10: int.
- adda 7;
val it = 12 : int (* still uses the a where adda was defined *)
                                                     Introduction to Standard ML 33
```

Gotcha! Mutually Recursive Function Scope

Introduction to Standard ML 34

Your turn: translate fib-iter to SML

Local Naming via let

let is used to define local names. Any such names "shadow" existing definitions from the surrounding scope.

```
let val a = 27  (* 1st let binding *)
  val b = 3  (* 2nd binding *)
  fun fact x = x + 2  (* 3nd binding *)
  in fact (a div b) (* let body *)
end; (* end terminates the let *)
val it = 11 : int
```

let-bound names are only visible in the body of the let.

```
- fact (a div b);
  (* these are global names:
     * fact is factorial function.
     * a is 42
     * b is 10 *)
val it = 24 : int
```

Introduction to Standard ML 35

Pattern Matching with Tuples

```
val tpl = (1 + 2, 3 < 4, 5 * 6, 7 = 8)
(* val tpl = (3,true,30,false) : int * bool * int * bool *)

(* It is *very bad* SML style to use #1, #2, etc.
    to extract the components of a tuple. *)
val tpl2 = ((#1 tpl) + (#3 tpl), (#2 tpl) orelse (#4 tpl));
(* val tpl2 = (33,true) : int * bool *)

(* Instead can "deconstruct" tuples via pattern matching.
    *Always* do this rather than using #1, #2 etc. *)
val tpl3 =
    let val (i1, b1, i2, b2) = tpl
        in (i1 + i2, b1 orelse b2)
    end
(* val tpl3 = (33,true) : int * bool *)</pre>
```

Introduction to Standard ML 37

Local Functions in SML

Functions locally defined with let are often used in SML to improve program organization and name hiding, aspecially with tail recursive functions. For example:

```
fun fibIter n =
  let fun fibTail i fib_i fib_i_plus_1 =
      if i = n then (* "sees" n from outer definition *)
      fib_i
      else
        fibTail (i+1) fib_i_plus_1 (fib_i+fib_i_plus_1)
  in fibTail 0 0 1
  end
```
