Homework 1: Artificial Intelligence Intelligence
Due January 26th at 10pm

Part 0: Course Setup

1. CourseIntro

Introduce yourself by creating a CourseIntro introduction. Make a brief video in which you pronounce your whole name and share a fun fact.

2. Join the Gradescope Course

We will use Gradescope to manage assignment submissions. Please join the Gradescope course using this code: VB7X8W

Part 1: Starting Ideas about AI

Artificial intelligence is a very broad term that has been used to refer to many different kinds of technology, some that already exists, and some that may not even be possible. As we begin our exploration of AI, I’d like you to reflect on the ideas you already have about AI.

Question 1

What kinds of existing AI technologies are you excited about, and why?

Question 2

What kinds of AI technologies do you worry about, and why? What ethical concerns do you have about existing technologies? What about technologies of the future?

Question 3

Is there a kind of AI technology that you hope exists in the future? Why do you think it would be beneficial?

\footnote{CourseIntros was created by Wellesley faculty alum Susan Buck.}
Part 2: Python Refresher

Starting next week, each homework assignment will involve a substantial amount of Python programming. Please spend some time practicing the following Python skills until you feel confident:

- Dictionaries, lists, and tuples
- List comprehensions
- Recursion
- Error handling: assert, try/except, and raise
- Classes

Complete the exercises in this Python review: https://inst.eecs.berkeley.edu/~cs188/sp24/projects/proj0/ from Berkeley. Take a screenshot when you pass all three autograder tests, and submit this along with your code as part of this assignment.

My solutions for Questions 2 and 3 are only a couple of lines of code. Your life will be easier in this class if you become familiar enough with Python list comprehensions to do this as well.

If you find that you are rusty on Python, you can study from this Python review. Homework assignments will assume that you are comfortable with everything that it covers.

Command Line You will need to be able to run Python files from the command line and do some basic file manipulation in this class. If you don’t know how to use the command line, please work through this guide put together by the CS Club: Shell Workshop materials.

Part 3: Reading Reflections

These questions ask you to reflect on Jordan 2019.

Question 1

Briefly summarize the differences between the terms AI, IA, and II as Jordan uses them.

Which do you personally find the most interesting, and why?

Question 2

Humans are notoriously bad at estimating the intelligence of non-humans. Many of the forms of AI that we will discuss in this class are about mimicking human abilities. Do you think this is an appropriate goal or a limitation?

---

2 Also, of humans.
Submission

To submit your homework, zip together your write-up, the files you modified in Part 2, and a screenshot of the autograder. Submit your work as a zip file on Gradescope.
