

# Context-Free Languages

# Extending Our Reach

---

Finite automata and people are *language recognition devices*.

Regular expressions and people are *language generating devices*.

Finite automata *recognize* and regular expressions *generate* an important but limited class of languages.

# People Languages

---

A grammar for the English language tells us whether a particular sentence is well formed or not.

A typically English grammar is "a sentence can consist of a noun phrase followed by a predicate."

More concisely, we write

$\langle \textit{sentence} \rangle \rightarrow \langle \textit{noun\_phrase} \rangle \langle \textit{predicate} \rangle$

# So What's a Noun Phrase?

---

A sentence is

$\langle sentence \rangle \rightarrow \langle noun\_phrase \rangle \langle predicate \rangle$

We must also provide definitions for the newly introduced constructs  $\langle noun\_phrase \rangle$  and  $\langle predicate \rangle$ .

$\langle noun\_phrase \rangle \rightarrow \langle article \rangle \langle noun \rangle$

$\langle predicate \rangle \rightarrow \langle verb \rangle$

# Generating Well Formed Sentences

---

Grammar rules so far:

$\langle sentence \rangle \rightarrow \langle noun\_phrase \rangle \langle predicate \rangle$

$\langle noun\_phrase \rangle \rightarrow \langle article \rangle \langle noun \rangle$

$\langle predicate \rangle \rightarrow \langle verb \rangle$

To complete our simple grammar, we associate actual words with the terms  $\langle article \rangle$ ,  $\langle noun \rangle$ , and  $\langle verb \rangle$ .

$\langle article \rangle \rightarrow a$

$\langle article \rangle \rightarrow the$

$\langle noun \rangle \rightarrow student$

$\langle verb \rangle \rightarrow relaxes$

$\langle verb \rangle \rightarrow studies$

# Context-Free Grammars

---

A *context-free grammar*  $G$  is a quadruple  $(V, \Sigma, R, S)$ , where

$V$  is a finite set called *variables*,

$\Sigma$  is a finite set, disjoint from  $V$ , called the *terminals*

$R$  is a finite subset of  $V \times (V \cup \Sigma)^*$  called *rules*, and

$S$  (the *start symbol*) is an element of  $V$ .

For any  $A \in V$  and  $u \in (V \cup \Sigma)^*$ , we write  $A \rightarrow u$  whenever  $(A, u) \in R$ .

# The Language of a Grammar

---

If  $u, v, w \in (V \cup \Sigma)^*$  and  $A \rightarrow w$  is a rule, then we say  $uAv$  *yields*  $uwv$  and write  $uAv \Rightarrow uwv$ .

Write  $u \xRightarrow{*} v$  (and read  $u$  derives  $v$ ) if

$$u \Rightarrow u_1 \Rightarrow u_2 \Rightarrow \dots \Rightarrow u_k \Rightarrow v.$$

The *language of the grammar*  $G$  is

$$L(G) = \{ w \in \Sigma^* \mid S \xRightarrow{*} w \}.$$

## For Example

---

Consider  $G = (V, \Sigma, R, S)$ , where

$$V = \{S\},$$

$$\Sigma = \{a, b\}, \text{ and}$$

$$R = \{ S \rightarrow aSa \mid bSb \mid aSb \mid bSa \mid \varepsilon \}.$$

Is there a grammar whose language is

$$PAL = \{ w \in \Sigma^* \mid w = \text{reverse}(w) \}?$$

# Arithmetic Expressions & Parse Trees

---

Consider  $G = (V, \Sigma, R, S)$ , where

$$V = \{ \langle \text{EXPR} \rangle, \langle \text{TERM} \rangle, \langle \text{FACTOR} \rangle \},$$

$$\Sigma = \{ a, +, \times, (, ) \},$$

$$R = \{ \langle \text{EXPR} \rangle \rightarrow \langle \text{EXPR} \rangle + \langle \text{TERM} \rangle \mid \langle \text{TERM} \rangle, \\ \langle \text{TERM} \rangle \rightarrow \langle \text{TERM} \rangle \times \langle \text{FACTOR} \rangle \mid \langle \text{FACTOR} \rangle, \\ \langle \text{FACTOR} \rangle \rightarrow (\langle \text{EXPR} \rangle) \mid a \},$$

$$S = \langle \text{EXPR} \rangle.$$

# Arithmetic Expressions & Parse Trees

---

Let's do the parse tree for  $a+axa$ .

Let's do the parse tree for  $(a+a)xa$ .

# Needlessly Complicated?

---

How about just

$$\begin{aligned} \langle \text{EXPR} \rangle &\rightarrow \langle \text{EXPR} \rangle + \langle \text{EXPR} \rangle \mid \\ &\langle \text{EXPR} \rangle \times \langle \text{EXPR} \rangle \mid \\ &(\langle \text{EXPR} \rangle) \mid \\ &a \end{aligned}$$

A grammar  $G$  is *ambiguous* if some string  $w$  has two or more different leftmost derivations.

# Regular Languages are Context-Free

1. Make variable  $R_i$  for each state  $q_i$ .
2. Add rule  $R_i \rightarrow aR_j$  if there is a transition from  $q_i$  to  $q_j$  on symbol  $a$
3. Add rule  $R_i \rightarrow \varepsilon$  if  $q_i$  is an accept state
4. Make  $R_0$  the start variable

# Chomsky Normal Form

---

A context-free grammar  $G$  is in *Chomsky normal form* if every rule is of the form

$$S \rightarrow \varepsilon$$

$$A \rightarrow BC$$

$$A \rightarrow a$$

where  $A, B, C \in V$ ,  $B \neq S \neq C$ , and  $a \in \Sigma$ .

# Chomsky Normal Form

---

**Theorem** Any context-free language is generated by a context-free grammar in Chomsky normal form.

- Proof**
1. Make sure  $S$  appears only on the left.
  2. Remove empty rules:  $A \rightarrow \varepsilon$ .
  3. Handle unit rules:  $A \rightarrow B$ .
  4. Fix all the rest.

$$S \rightarrow ASA \mid aA$$

$$A \rightarrow b \mid \varepsilon$$
