

x86 (Part 2)

		Stack Address	Stack Content (each cell = 8 bytes)
pushq	%rbp		
movq	%rsp, %rbp	0x138	0x007
movq	16(%rbp), %rdx		
movq	8(%rbp), %rax	0x130	0x280
movq	(%rax), %rax		
leaq	(%rax,%rax,4), %rax	0x128	0x003
andq	%rdx, %rax		
subq	%rdx, %rax	0x120	
popq	%rbp		
ret		0x118	0x138

Initial register values:

%rsp	0x120	%rbp	0x138
------	-------	------	-------

What is the content of %rax by the end of this code's execution?

0x0

```

pushq    %rbp          // %rsp = 0x118, (0x118) = 0x138

movq    %rsp, %rbp      // %rbp = 0x118
movq    16(%rbp), %rdx  // %rdx = (0x128) = 0x3
movq    8(%rbp), %rax   // %rax = (0x120) = 0x138
movq    (%rax), %rax     // %rax = (0x138) = 0x7
leaq    (%rax,%rax,4), %rax  // %rax = 0x7 + 0x7 * 4 = 0x23
andq    %rdx, %rax      // %rax = 0x3 & 0x23 = 0x3
subq    %rdx, %rax      // %rax = 0x3 - 0x3 = 0
popq    %rbp          // %rsp = 0x120
ret

```
