Computer Science 240 Binary Operations

Assignment for Lab 2

Print this sheet and hand in completed exercises at the beginning of lab.

Perform addition on the following binary and hexadecimal numbers (assume **two's complement** format!). Indicate whether there is a carry-out or an overflow for each addition.

For the first 2 calculations, assume **16- bit representation.** Do the calculation using the binary values.

Then, convert the result to hexadecimal notation. To convert, divide the 16 binary digits of the result into groups of 4, and translate each group to the corresponding hexadecimal value. Note that if there is a carry-out, that is the 17th bit, and it is not used in result or in the hexadecimal translation!

1.	11111111111111 + <u>1111111111111</u>	Carry-Out?	Overflow?
Binary result :			
Hexadecimal resul	lt:		
		Carry-Out?	Overflow?
2.	$\begin{array}{c} 0\ 1\ 1\ 1\ 1\ 1\ 1\ 1\ 0\ 0\ 0\ 0\ 0\ 0 \\ +\ 0\ 1\ 1\ 1\ 1\ 1\ 1\ 1\ 0\ 0\ 1\ 1\ 0\ 0\ 1 \end{array}$		
Binary result :			
Hexadecimal result	lt:		

Now, assume 32-bit representation, using hexadecimal notation, and specify result in hexadecimal.

Hexadecimal result:

Hexadecimal result:

Examine the following C statements:

```
int \ x,y;
int \ sum = x + y;
int \ overflow = ((x > 0 && y > 0 && sum < 0) \mid | (x < 0 && y < 0 && sum > 0));
long \ int \ carryout = (((long \ int)x + (long \ int)y) >> 32;
```

5. Explain why the expressions for overflow and carryout when x and y are added will yield the correct result:

Use specific values for x and y (same as from exercises 3 and 4 above) to show that the correct results for overflow and carryout are performed for the given C expressions:

6.
$$x = 0x A A F F 9 0 1 4$$

 $y = 0x A A E 3 C D 1 2$

7.
$$x = 0x 7 F A A 3 2 7 8$$

 $y = 0x 6 0 2 4 C D 1 2$

8. Complete Modules 1 and 2 of the <u>Linux Survival</u> (linuxsurvival.com) tutorial. It runs in the web browser, so you do not need to yet access a real Linux machine to get started (we will practice doing that in lab this week).
