

x86 Control Flow

(Part A, Part B)

Condition codes, comparisons, and tests
[Un]Conditional jumps and conditional moves
Translating if-else, loops, and switch statements

<https://cs.wellesley.edu/~cs240/>

x86 Control Flow 1

1. Compare and test: conditions

`cmpq b,a` computes $a - b$, sets flags, discards result

Which flags indicate that $a < b$? (signed? unsigned?)

`testq b,a` computes $a \& b$, sets flags, discards result

Common pattern:

`testq %rax, %rax`

What do ZF and SF indicate?

x86 Control Flow 3

Conditionals and Control Flow

Two key pieces

1. Comparisons and tests: check conditions
2. Transfer control: choose next instruction

Familiar C constructs

- if else
- while
- do while
- for
- break
- continue

Processor Control-Flow State

Condition codes (a.k.a. *flags*)

1-bit registers hold flags set by last ALU operation

ZF	Zero Flag	result == 0
SF	Sign Flag	result < 0
CF	Carry Flag	carry-out/unsigned overflow
OF	Overflow Flag	two's complement overflow

`%rip`

Instruction pointer
(a.k.a. program counter)

register holds address of next instruction to execute

x86 Control Flow 2

(Aside) Saving conditions as Boolean values

→ **setg**: set if greater

stores byte:

0x01 if $\sim(SF \wedge OF) \wedge \sim ZF$
0x00 otherwise

```
long gt(int x, int y) {
    return x > y;
}
```

```
gt:
    cmpq %rsi,%rdi      # compare: x - y
    setg %al              # al = x > y
    movzbq %al,%rax      # zero rest of %rax
    retq
```

Zero-extend from Byte (8 bits) to Quadword (64 bits)

<code>%rax</code>	<code>%eax</code>	<code>%ah</code>	<code>%al</code>
-------------------	-------------------	------------------	------------------

set__ comes in same flavors
as j__(next slide)

x86 Control Flow 4

2. Jump: choose next instruction

Jump/branch to different part of code by setting %rip.

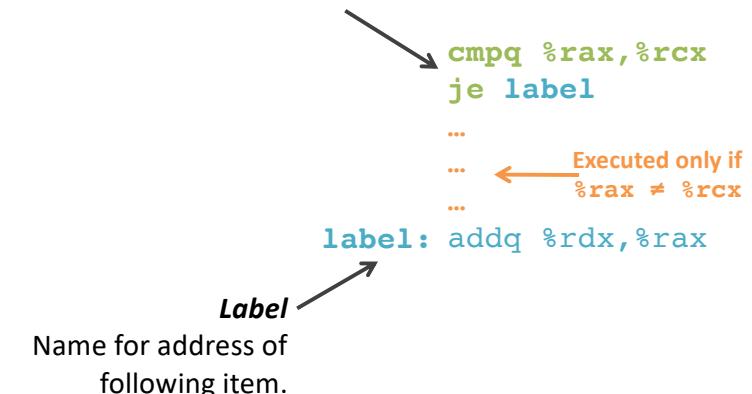

j__	Condition	Description
jmp	1	Unconditional
je	ZF	Equal / Zero
jne	~ZF	Not Equal / Not Zero
js	SF	Negative
jns	~SF	Nonnegative
jg	~(SF^OF) & ~ZF	Greater (Signed)
jge	~(SF^OF)	Greater or Equal (Signed)
jl	(SF^OF)	Less (Signed)
jle	(SF^OF) ZF	Less or Equal (Signed)
ja	~CF & ~ZF	Above (unsigned)
jb	CF	Below (unsigned)

x86 Control Flow 5

Jump for control flow

Jump immediately follows comparison/test.

Together, they make a decision:
"if %rcx == %rax then jump to label."

x86 Control Flow 6

Conditional branch example

```

long absdiff(long x, long y) {
    long result;
    if (x > y) {
        result = x-y;
    } else {
        result = y-x;
    }
    return result;
}
    
```

```

absdiff:
    cmpq %rsi, %rdi
    jle .L7
    subq %rsi, %rdi
    movq %rdi, %rax
.L8:
    retq
.L7:
    subq %rdi, %rsi
    movq %rsi, %rax
    jmp .L8
    
```

Labels
Name for address of following item.

How did the compiler create this?

x86 Control Flow 7

Control-Flow Graph

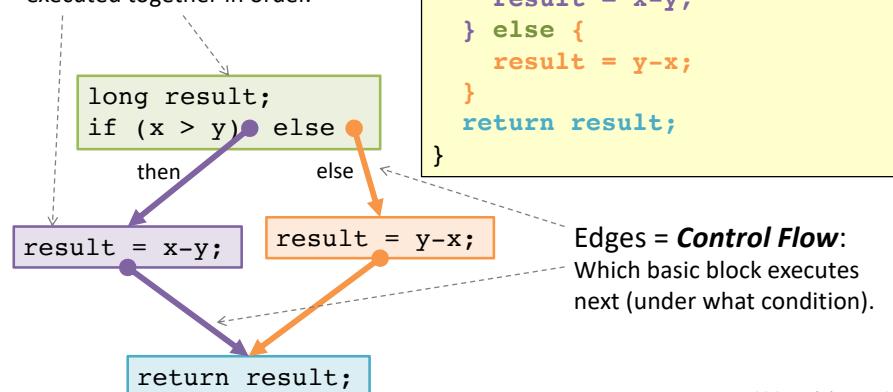

Code flowchart/directed graph.

Introduced by Fran Allen, et al.
Won the 2006 Turing Award
for her work on compilers.

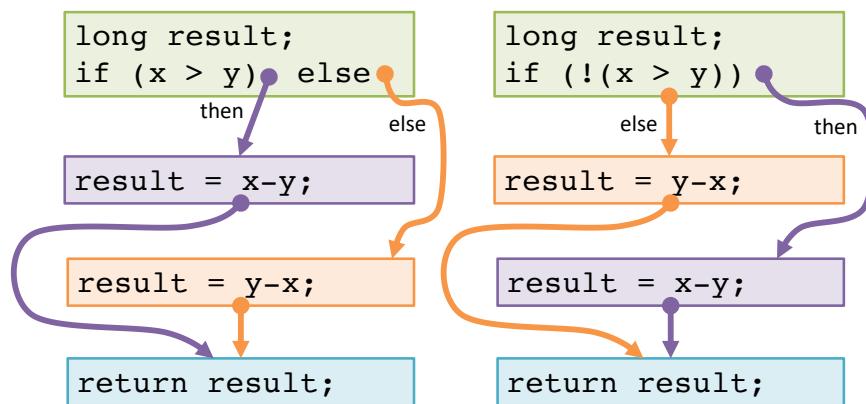

Nodes = Basic Blocks:

Straight-line code always executed together in order.

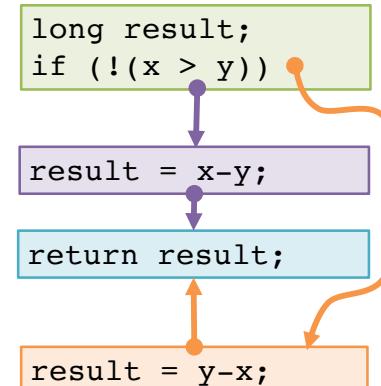

x86 Control Flow 8

Choose a linear order of basic blocks.

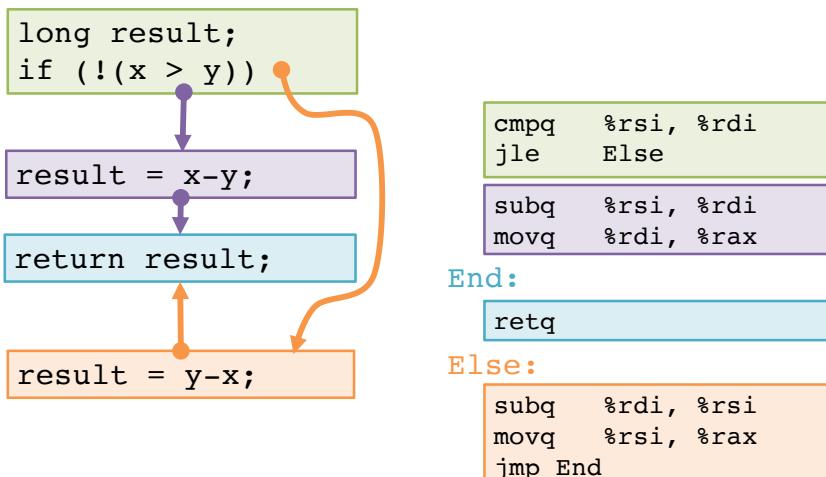

x86 Control Flow 9

Choose a linear order of basic blocks.

x86 Control Flow 10

Translate basic blocks with jumps + labels

Why might the compiler choose this basic block order instead of another valid order?

x86 Control Flow 11

Execute absdiff

ex

Registers	Value
%rax	
%rdi	5
%rsi	3

```
cmpq %rsi, %rdi
jle Else
subq %rsi, %rdi
movq %rdi, %rax
End:
retq
Else:
subq %rdi, %rsi
movq %rsi, %rax
jmp End
```

Registers

%rax	
%rdi	5
%rsi	3

x86 Control Flow 12

Execute absdiff

```

    cmpq  %rsi, %rdi
    jle   Else
    subq  %rsi, %rdi
    movq  %rdi, %rax
End:
    retq
Else:
    subq  %rdi, %rsi
    movq  %rsi, %rax
    jmp End

```

ex

Registers
%rax
%rdi 4
%rsi 7

x86 Control Flow 15

Note: CSAPP shows translation with goto

```

long absdiff(long x,long y){
    int result;
    if (x > y) {
        result = x-y;
    } else {
        result = y-x;
    }
    return result;
}

```

```

long goto_ad(long x,long y){
    int result;
    if (x <= y) goto Else;
    result = x-y;
Else:
    result = y-x;
    goto End;
}

```

x86 Control Flow 18

Note: CSAPP shows translation with goto

```

long goto_ad(long x, long y){
    long result;
    if (x <= y) goto Else;
    result = x-y;
End:
    return result;
Else:
    result = y-x;
    goto End;
}

```

```

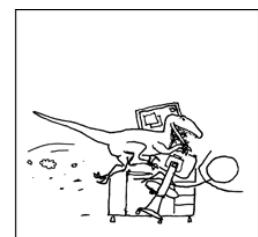

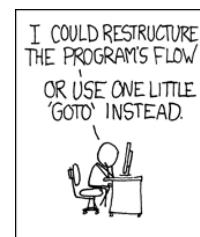

absdiff:
    cmpq  %rsi, %rdi
    jle   Else
    subq  %rsi, %rdi
    movq  %rdi, %rax
End:
    retq
Else:
    subq  %rdi, %rsi
    movq  %rsi, %rax
    jmp End

```

Close to assembly code.

x86 Control Flow 19

But never use goto in your source code!

<http://xkcd.com/292/>

x86 Control Flow 20

Compile if-else

ex

```
long wacky(long x, long y){
    long result;
    if (x + y > 7) {
        result = x;
    } else {
        result = y + 2;
    }
    return result;
}
```

Assume x is available in %rdi,
y is available in %rsi.

Place result in %rax for return.

wacky:

x86 Control Flow 21

Compile if-else (solution #1)

ex

```
long wacky(long x, long y){
    long result;
    if (x + y > 7) {
        result = x;
    } else {
        result = y + 2;
    }
    return result;
}
```

Assume x is available in %rdi,
y is available in %rsi.

Place result in %rax for return.

wacky:

```
    movq %rdi, %rdx
    addq %rsi, %rdx
    cmpq $7, %rdx
    jle Else
```

```
    movq %rdi, %rax
```

End:
 retq

Else:
 addq \$2, %rsi
 movq %rsi, %rax
 jmp End

x86 Control Flow 22

Compile if-else (solution #2)

ex

```
long wacky(long x, long y){
    long result;
    if (x + y > 7) {
        result = x;
    } else {
        result = y + 2;
    }
    return result;
}
```

Assume x is available in %rdi,
y is available in %rsi.

Place result in %rax for return.

wacky:

```
    leaq (%rdi, %rsi), %rdx
    cmpq $7, %rdx
    jle Else

    movq %rdi, %rax

End:
    retq

Else:
    leaq 2(%rsi), %rax
    jmp End
```

x86 Control Flow 23

Encoding jumps: PC-relative addressing

0x100	cmpq %rax, %rbx	0x1000
0x102	je 0x70	0x1002
0x104	...	0x1004
...
0x174	addq %rax, %rbx	0x1074

PC-relative *offsets* support relocatable code.
Absolute branches do not (or it's hard).

x86 Control Flow 24

x86 Control Flow

(Part A, Part B)

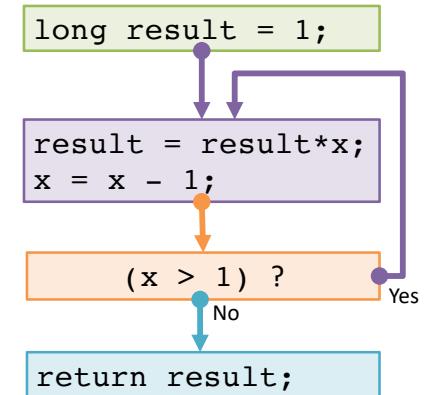

Condition codes, comparisons, and tests
[Un]Conditional jumps and conditional moves
Translating if-else, loops, and switch statements

<https://cs.wellesley.edu/~cs240/>

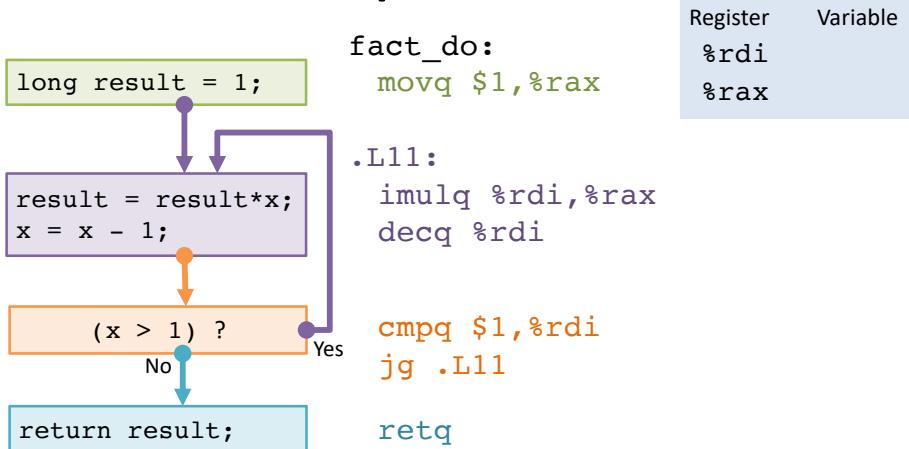

x86 Control Flow 25

do while loop

```
long fact_do(long x) {
    long result = 1;
    do {
        result = result * x;
        x = x - 1;
    } while (x > 1);
    return result;
}
```

do while loop

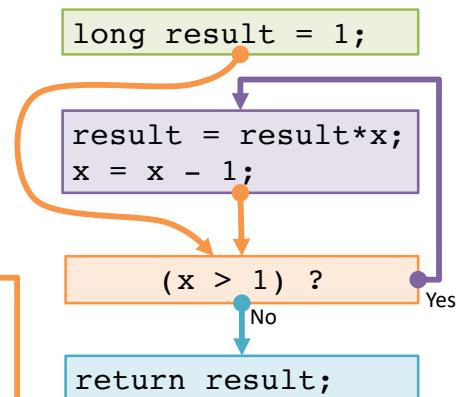

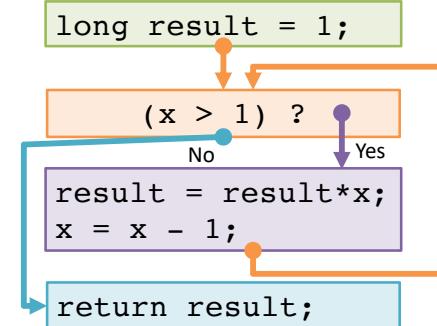

Why put the loop condition at the end?

x86 Control Flow 27

while loop

```
long fact_while(long x){
    long result = 1;
    while (x > 1) {
        result = result * x;
        x = x - 1;
    }
    return result;
}
```

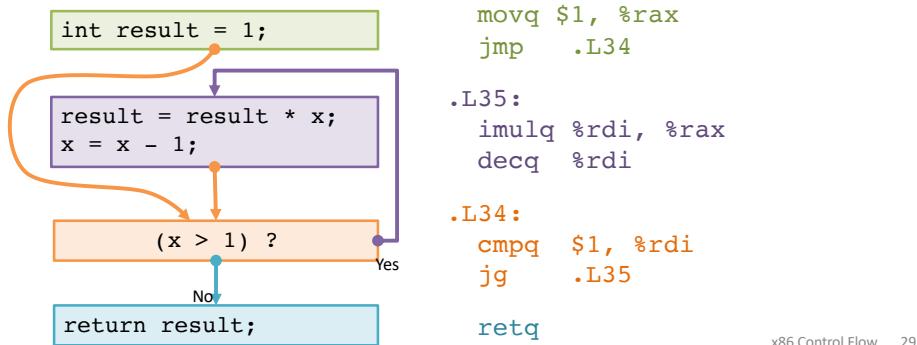

This order is used by GCC for x86-64. Why?

x86 Control Flow 28

while loop

```
long fact_while(long x){
    long result = 1;
    while (x > 1) {
        result = result * x;
        x = x - 1;
    }
    return result;
}
```

for loop: square-and-multiply

optional

```
/* Compute x raised to nonnegative power p */
int power(int x, unsigned int p) {
    int result;
    for (result = 1; p != 0; p = p>>1) {
        if (p & 0x1) {
            result = result * x;
        }
        x = x*x;
    }
    return result;
}
```

$$x^m * x^n = x^{m+n}$$

$$\begin{array}{ccccccc} 0 & \dots & 0 & 1 & 0 & 1 & 1 \\ 1^{2^0} * \dots * 1^{16} * x^8 * 1^4 * x^2 * x^1 & = & x^{11} \\ 1 = x^0 & x = x^1 \end{array}$$

Algorithm

Exploit bit representation: $p = p_0 + 2p_1 + 2^2p_2 + \dots + 2^{n-1}p_{n-1}$

Gives: $x^p = z_0 \cdot z_1^2 \cdot (z_2^2)^2 \cdot \dots \cdot (\underbrace{\dots \cdot ((z_{n-1}^2)^2)}_{n-1 \text{ times}})^2$

$z_i = 1$ when $p_i = 0$
 $z_i = x$ when $p_i = 1$

Complexity $O(\log p) = O(\text{sizeof}(p))$

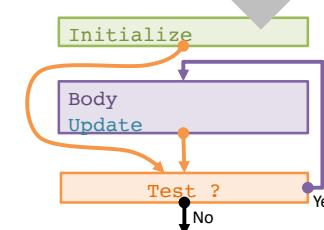

Example

$$\begin{aligned} 3^{11} &= 3^1 * 3^2 * 3^8 \\ &= 3^1 * 3^2 * ((3^2)^2)^2 \end{aligned}$$

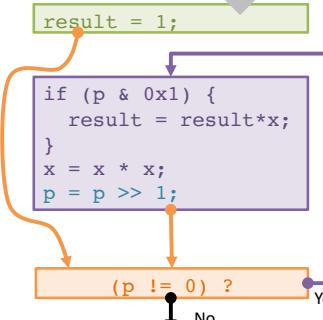

for loop translation

```
for (Initialize; Test; Update) {
    Body
}
```

```
Initialize;
while (Test) {
    Body;
    Update;
}
```

```
for (result = 1; p != 0; p = p>>1) {
    if (p & 0x1) {
        result = result * x;
    }
    x = x * x;
}
```

x86 Control Flow 30

for loop: power iterations

optional

```
/* Compute x raised to nonnegative power p */
int power(int x, unsigned int p) {
    int result;
    for (result = 1; p != 0; p = p>>1) {
        if (p & 0x1) {
            result = result * x;
        }
        x = x*x;
    }
    return result;
}
```

iterations	result	x	p
0	1	3	$11 = 1011_2$
1	3	9	$5 = 101_2$
2	27	81	$2 = 10_2$
3	27	6561	$1 = 1_2$
4	177147	43046721	0_2

x86 Control Flow 32

(Aside) Conditional Move

Why? Branch prediction in pipelined/OoO processors.

cmov_ src, dest
if (Test) Dest \leftarrow Src

```
long absdiff(long x, long y) {  
    return x>y ? x-y : y-x;  
}
```

```
absdiff:  
    movq    %rdi, %rax  
    subq    %rsi, %rax  
    movq    %rsi, %rdx  
    subq    %rdi, %rdx  
    cmpq    %rsi, %rdi  
    cmovle  %rdx, %rax  
    ret
```

```
long absdiff(long x, long y) {  
    long result;  
    if (x > y) {  
        result = x - y;  
    } else {  
        result = y - x;  
    }  
    return result;
```

x86 Control Flow 33

(Aside) Bad uses of conditional move

Expensive Computations

```
val = Test(x) ? Hard1(x) : Hard2(x);
```

Risky Computations

```
val = p ? *p : 0;
```

Computations with side effects

```
val = x > 0 ? x*=7 : x+=3;
```

x86 Control Flow 34

switch statement

```
long switch_eg (long x, long y, long z) {  
    long w = 1;  
    switch(x) {  
        case 1:  
            w = y * z;  
            break;  
        case 2:  
            w = y - z;  
            break;  
        case 3:  
            w += z;  
            break;  
        case 5:  
        case 6:  
            w -= z;  
            break;  
        default:  
            w = 2;  
    }  
    return w;  
}
```

Fall through cases

Multiple case labels

Missing cases use default

Lots to manage:
use a *jump table*.

x86 Control Flow 35

switch jump table structure

C code:

```
switch(x) {  
    case 1: <some code>  
    break;  
    case 2: <some code>  
    case 3: <some code>  
    break;  
    case 5:  
    case 6: <some code>  
    break;  
    default: <some code>  
}
```

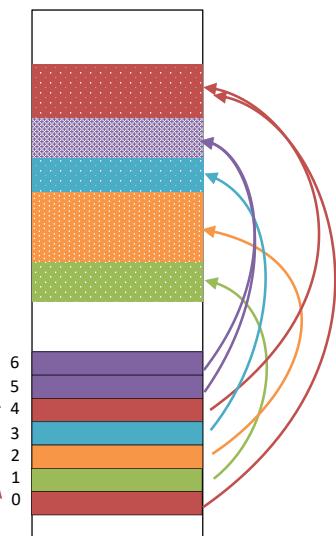

Translation sketch:

```
if (0 <= x && x <= 6)  
    addr = jumpTable[x];  
    goto addr;  
else  
    goto default;
```

Memory

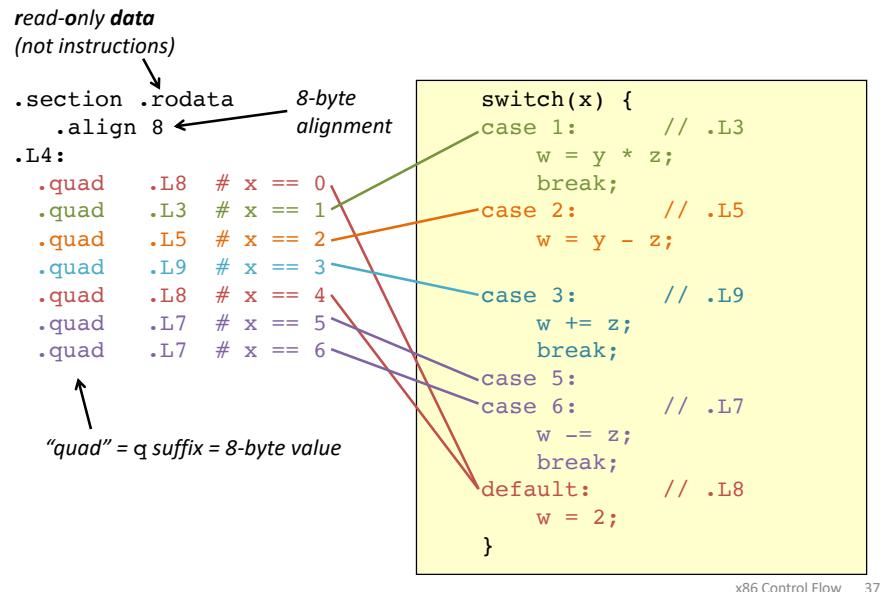

Code Blocks

Jump Table

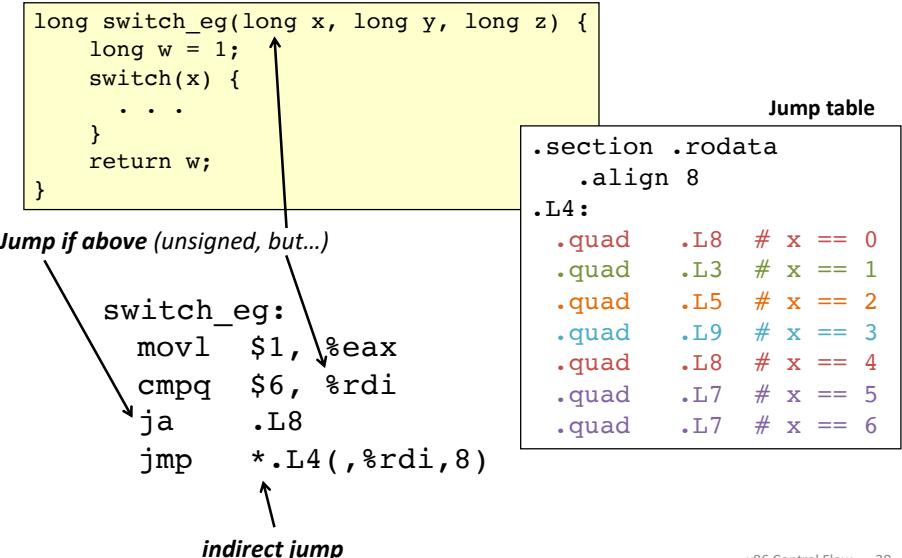

x86 Control Flow 36

switch jump table assembly declaration

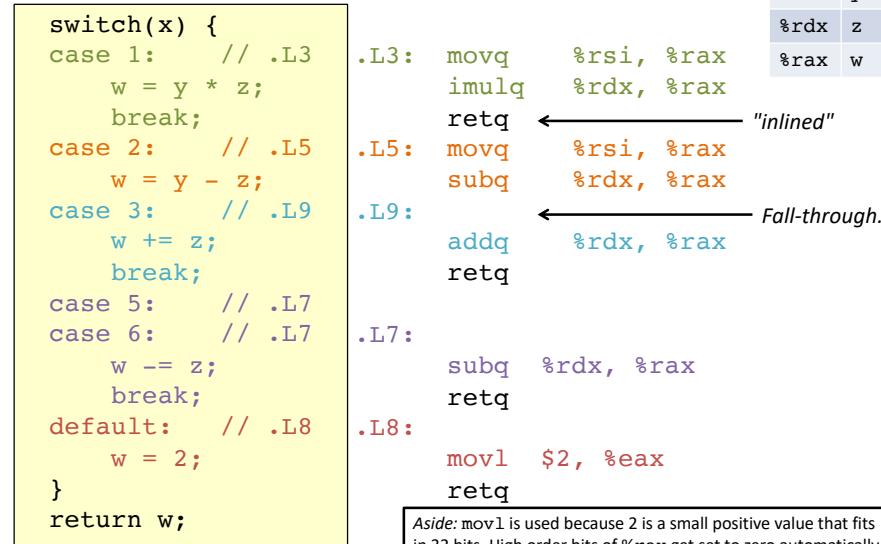

x86 Control Flow 37

switch case dispatch

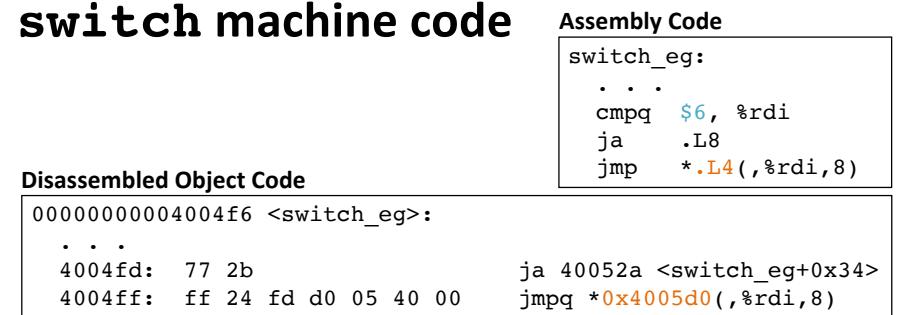

x86 Control Flow 38

switch cases

x86 Control Flow 39

switch machine code

Inspect jump table contents using GDB.

Examine contents as `0x4005d0` addresses

	Address of code for case 0	Address of code for case 1
(gdb) x/7a 0x4005d0	0x40052a <switch_eg+52>	0x400506 <switch_eg+16>
0x4005e0:	0x40050e <switch_eg+24>	0x400518 <switch_eg+34>
0x4005f0:	0x40052a <switch_eg+52>	0x400521 <switch_eg+43>
0x400600:	0x400521 <switch_eg+43>	Address of code for case 6

x86 Control Flow 40

Would you implement this with a jump table?

```
switch(x) {  
    case 0:      <some code>  
        break;  
    case 10:     <some code>  
        break;  
    case 52000:  <some code>  
        break;  
    default:    <some code>  
        break;  
}
```

x86 Control Flow

(Part A, Part B)

Condition codes, comparisons, and tests

[Un]Conditional jumps and conditional moves

Translating if-else, loops, and switch statements
