

# Representing Data with Bits

bits, bytes, numbers, and notation

## positional number representation

base = 10 (*decimal*)

2	4	0
100	10	1
10 <sup>2</sup>	10 <sup>1</sup>	10 <sup>0</sup>
2	1	0

= 2 × 10<sup>2</sup> + 4 × 10<sup>1</sup> + 0 × 10<sup>0</sup>

*weight* (points to 100, 10, 1)  
*position* (points to 2, 1, 0)

**Base** determines:

Maximum digit (base – 1). Minimum digit is 0.

Weight of each position.

Each position holds a digit.

Represented value = sum of all position values

*position value* = *digit value* × *base*<sup>*position*</sup>

## binary = base 2

Binary digits are called **bits**: 0, 1

base = 2 (*binary*)

1	0	1	1
8	4	2	1
2 <sup>3</sup>	2 <sup>2</sup>	2 <sup>1</sup>	2 <sup>0</sup>
3	2	1	0

= 1 × 2<sup>3</sup> + 0 × 2<sup>2</sup> + 1 × 2<sup>1</sup> + 1 × 2<sup>0</sup>

*weight* (points to 8, 4, 2, 1)  
*position* (points to 3, 2, 1, 0)

When ambiguous, subscript with base:

101<sub>10</sub> Dalmatians (movie)

101<sub>2</sub>-Second Rule (folk wisdom for food safety)

## Powers of 2: memorize up to ≥ 2<sup>10</sup> (in base ten)

ex

Power: 2 <sup>n</sup>	Decimal value
0	
1	
2	
3	
4	
5	
6	
7	
8	
9	
10	
11	
12	
13	

## conversion from binary to decimal

ex

$$101101_2 = ?_{10}$$

Interpret the positional representation according to the base:  
sum the place weights where 1 appears (in either direction).

5

## conversion from decimal to binary

ex

$$19_{10} = ?_2$$

Divide-by-2 Approach  
(Right to Left)

64 32 16 8 4 2 1

Quotient

Remainder?

Powers-of-2 Approach  
(Left to Right)

64 32 16 8 4 2 1

Value

Power that fits?

6

## binary arithmetic

ex

$$110_2 + 1011_2 = ?_2$$

$$1101_2 - 1011_2 = ?_2$$

$$1001011_2 \times 2_{10} = ?_2$$

7

## conversion and arithmetic

ex

$$19_{10} = ?_2$$

$$1001_2 = ?_{10}$$

$$240_{10} = ?_2$$

$$11010011_2 = ?_{10}$$

$$101_2 + 1011_2 = ?_2$$

$$1001011_2 \times 2_{10} = ?_2$$

8

What do you call 4 bits?

**byte = 8 bits**

a.k.a. octet

**Smallest unit of data**

used by a typical modern computer

**Binary** 00000000<sub>2</sub> -- 11111111<sub>2</sub>

**Decimal** 000<sub>10</sub> -- 255<sub>10</sub>

**Hexadecimal** 00<sub>16</sub> -- FF<sub>16</sub>

Byte = 2 hex digits!

Programmer's hex notation (C, etc.):

0xB4 = B4<sub>16</sub>

Octal (base 8) also useful.

Hex    Decimal    Binary

0	0	0000
1	1	0001
2	2	0010
3	3	0011
4	4	0100
5	5	0101
6	6	0110
7	7	0111
8	8	1000
9	9	1001
A	10	1010
B	11	1011
C	12	1100
D	13	1101
E	14	1110
F	15	1111

## char: representing characters

A C-style string is represented by a series of bytes (*chars*).

- One-byte **ASCII codes** for each character.
- ASCII = American Standard Code for Information Interchange

32	space	48	0	64	@	80	P	96	`	112	p
33	!	49	1	65	A	81	Q	97	a	113	q
34	"	50	2	66	B	82	R	98	b	114	r
35	#	51	3	67	C	83	S	99	c	115	s
36	\$	52	4	68	D	84	T	100	d	116	t
37	%	53	5	69	E	85	U	101	e	117	u
38	&	54	6	70	F	86	V	102	f	118	v
39	'	55	7	71	G	87	W	103	g	119	w
40	(	56	8	72	H	88	X	104	h	120	x
41	)	57	9	73	I	89	Y	105	i	121	y
42	*	58	:	74	J	90	Z	106	j	122	z
43	+	59	;	75	K	91	[	107	k	123	{
44	,	60	<	76	L	92	\	108	l	124	
45	-	61	=	77	M	93	]	109	m	125	}
46	.	62	>	78	N	94	^	110	n	126	~
47	/	63	?	79	O	95	_	111	o	127	del

## word |wɜːd|, n.

**Natural unit of data used by processor.**

**Fixed size** (e.g. 32 bits, 64 bits)

Defined by ISA: Instruction Set Architecture  
machine instruction operands

word size = register size = address size

Java/C int = 4 bytes: 11,501,584

MSB: most significant bit

LSB: least significant bit

## fixed-size data representations

(size in bytes)

Java Data Type	C Data Type	[word = 32 bits]	[word = 64 bits]
boolean		1	1
byte		1	1
char	char	2	2
short	short int	2	2
int	int	4	4
float	float	4	4
	long int	4	8
double	double	8	8
long	long long	8	8
	long double	8	16

Depends on word size!

## bitwise operators

bit = Boolean  
0 = false  
1 = true

**Bitwise operators** on fixed-width **bit vectors**.

AND &   OR |   XOR ^   NOT ~

$\begin{array}{r} 01101001 \\ \& 01010101 \\ \hline 01000001 \end{array}$	$\begin{array}{r} 01101001 \\   01010101 \\ \hline 01010101 \end{array}$	$\begin{array}{r} 01101001 \\ \wedge 01010101 \\ \hline 00111100 \end{array}$	$\begin{array}{r} \sim 01010101 \\ \hline 10101010 \end{array}$
---	--	---	---

ex

Laws of Boolean algebra apply bitwise.

e.g., DeMorgan's Law:  $\sim(A | B) = \sim A \& \sim B$

$$\begin{array}{r} 01010101 \\ \wedge 01010101 \\ \hline 00000000 \end{array}$$

13

## bitwise operators in C

& | ^ ~   apply to any *integral* data type  
long, int, short, char, unsigned

Examples (**char**)

$\sim 0x41 =$

$\sim 0x00 =$

$0x69 \& 0x55 =$

$0x69 | 0x55 =$

Many bit-twiddling puzzles in upcoming assignment

## Representation Example 1: Sets as Bit Vectors

**Representation:**  $n$ -bit vector gives subset of  $\{0, \dots, n-1\}$ .

$$a_i = 1 \equiv i \in A$$

$$a = 0b01101001 \quad A = \{0, 3, 5, 6\}$$

76543210

$$b = 0b01010101 \quad B = \{0, 2, 4, 6\}$$

76543210

### Bitwise Operations

- $a \& b = 0b01000001$   $\{0, 6\}$
- $a | b = 0b01111101$   $\{0, 2, 3, 4, 5, 6\}$
- $a \wedge b = 0b00111100$   $\{2, 3, 4, 5\}$
- $\sim b = 0b10101010$   $\{1, 3, 5, 7\}$

### Set Operations

- Intersection
- Union
- Symmetric difference
- Complement

19

## logical operations in C

**&& || !** apply to any "integral" data type  
**long, int, short, char, unsigned**

**0 is false nonzero is true result always 0 or 1**

**early termination a.k.a. short-circuit evaluation**

Examples (**char**)

**!0x41 =**  
**!0x00 =**  
**!!0x41 =**

**0x69 && 0x55 =**  
**0x69 || 0x55 =**

ex

20

## Representation Example 2: Playing Cards

52 cards in 4 suits

How do we encode suits, face cards?

What operations should be easy to implement?

Get and compare rank

Get and compare suit

21

## Two possible representations

52 cards – 52 bits with bit corresponding to card set to 1

### “One-hot” encoding

Hard to compare values and suits independently  
Not space efficient

4 bits for suit, 13 bits for card value – 17 bits with two set to 1

### Pair of one-hot encoded values

Easier to compare suits and values independently  
Smaller, but still not space efficient

22

## Two better representations

Binary encoding of all 52 cards – only 6 bits needed

Number cards uniquely from 0  
Smaller than one-hot encodings.  
Hard to compare value and suit

Binary encoding of suit (2 bits) and value (4 bits) separately

Number each suit uniquely  
Number each value uniquely  
Still small  
Easy suit, value comparisons

23

## Compare Card Suits

**mask:** a bit vector that, when bitwise ANDed with another bit vector  $v$ , turns all *but* the bits of interest in  $v$  to 0

```
#define SUIT_MASK 0x30
```

```
int sameSuit(char card1, char card2) {
    return !((card1 & SUIT_MASK) ^ (card2 & SUIT_MASK));

    //same as (card1 & SUIT_MASK) == (card2 & SUIT_MASK);
}
```

```
char hand[5];          // represents a 5-card hand
...
if (sameSuit(hand[0], hand[1])) { ... }
```

24

## Compare Card Values

**mask:** a bit vector that, when bitwise ANDed with another bit vector  $v$ , turns all *but* the bits of interest in  $v$  to 0

```
#define VALUE_MASK
```

```
int greaterValue(char card1, char card2) {
```

```
}
```

```
char hand[5]; // represents a 5-card hand
```

```
...
```

```
if (greaterValue(hand[0], hand[1])) { ... }
```

ex

25

## Bit shifting

logical shift left 2

$x \ll 2$

logical shift right 2

$x \gg 2$

arithmetic shift right 2  $x \ggg 2$

fill with zeroes on left

10011001 x

00100110 0 1

11100110 0 1

lose bits on right

26

## Shift gotchas

*Logical or arithmetic shift right: how do we tell?*

C: compiler chooses

Usually based on type: rain check!

Java:  $\gg$  is arithmetic,  $\ggg$  is logical

Shift an  $n$ -bit type by at least 0 and no more than  $(n-1)$ .

C: other shift distances are undefined.

anything could happen

Java: shift distance is used modulo number of bits in shifted type

Given `int x:` `x << 34 == x << 2`

27

## Shift and mask: extract a bit field

Write a C function that

extracts the 2<sup>nd</sup> most significant byte

from its 32-bit integer argument.

Example behavior:

argument: 0b 01100001 01100010 01100011 01100100

expected result: 0b 00000000 00000000 00000000 01100010

All other bits are zero.

Desired bits in least significant byte.

```
int get2ndMSB(int x) {
```

```
}
```
