

Representing Data Structures

Multidimensional arrays
C structs

C: Array layout and indexing

ex

Write x86 code to load `val[i]` into `%eax`.

- Assume:
 - Base address of `val` is in `%rdi`
 - `i` is in `%rsi`

- Assume:
 - Base address of `val` is `28(%rsp)`
 - `i` is in `%rcx`

C: Arrays of pointers to arrays of ... reminder

```
int** zips = (int**)malloc(sizeof(int*)*3);
...
zips[0] = (int*)malloc(sizeof(int)*5);
...
int* zip0 = zips[0];
zip0[0] = 0;
zips[0][1] = 2;
zips[0][2] = 4;
zips[0][3] = 8;
zips[0][4] = 1;
```

```
int[][] zips = new int[3][];
zips[0] = new int[5] {0, 2, 4, 8, 1};
```

Java

C: Translate to x86

ex

```
void copyleft(int** zipCodes, long i, long j) {
    zipCodes[i][j] = zipCodes[i][j - 1];
}
```

C: Row-major nested arrays

```
int a[R][C];
```

Suppose a's base address is A.

$\&a[i][j]$ is $A + C \times \text{sizeof}(\text{int}) \times i + \text{sizeof}(\text{int}) \times j$
(regular unscaled arithmetic)

```
int* b = (int*)a; // Treat as larger 1D array
```

```
&a[i][j] == &b[ C*i + j ]
```

C: Strange array indexing examples

```
int sea[4][5];
```

| Reference | Address | Value |
|------------|---------------------------------------|-------|
| sea[3][3] | $76 + 20 \times 3 + 4 \times 3 = 148$ | 1 |
| sea[2][5] | | |
| sea[2][-1] | | |
| sea[4][-1] | | |
| sea[0][19] | | |
| sea[0][-1] | | |

C does not do any bounds checking.
Row-major array layout is guaranteed.

```
struct rec {
    int i;
    int a[3];
    int* p;
};
```

Base address

C structs

Like Java class/object without methods.

Compiler determines:

- Total size
- Offset of each field

```
struct rec x;
struct rec y;
x.i = 1;
x.a[1] = 2;
x.p = &(x.i);
```

```
// copy full struct
y = x;
```

```
struct rec* z;
z = &y;
(*z).i++;
// same as:
z->i++
```

```
struct rec {
    int i;
    int a[3];
    int* p;
};
```

Base address

C structs

Like Java class/object without methods.

Compiler determines:

- Total size
- Offset of each field

```
struct rec x;
struct rec y;
x.i = 1;
x.a[1] = 2;
x.p = &(x.i);
```

```
// copy full struct
y = x;
```

```
struct rec* z;
z = &y;
(*z).i++;
// same as:
z->i++
```

```

struct rec {
  int i;
  int a[3];
  int* p;
};

struct rec x;
struct rec y;
x.i = 1;
x.a[1] = 2;
x.p = &(x.i);

// copy full struct
y = x;

struct rec* z;
z = &y;
(*z).i++;
// same as:
z->i++

```

C structs

Like Java class/object without methods.

- Compiler determines:
- Total size
 - Offset of each field

```

struct rec {
  int i;
  int a[3];
  int* p;
};

struct rec x;
struct rec y;
x.i = 1;
x.a[1] = 2;
x.p = &(x.i);

// copy full struct
y = x;

struct rec* z;
z = &y;
(*z).i++;
// same as:
z->i++

```

C structs

Like Java class/object without methods.

- Compiler determines:
- Total size
 - Offset of each field

C: Accessing struct field

```

struct rec {
  int i;
  int a[3];
  int* p;
};

```

```

int get_i_plus_elem(struct rec* r, int index) {
  return r->i + r->a[index];
}

```

```

movl 0(%rdi),%eax # Mem[r+0]
addl 4(%rdi,%rsi,4),%eax # Mem[r+4*index+4]
retq

```

C: Struct field alignment

Unaligned Data

```

struct S1 {
  char c;
  double v;
  int i;
}* p;

```

Defines new struct type and declares variable p of type struct S1*

Aligned Data

Primitive data type requires K bytes

Address must be multiple of K

C: align every struct field accordingly.

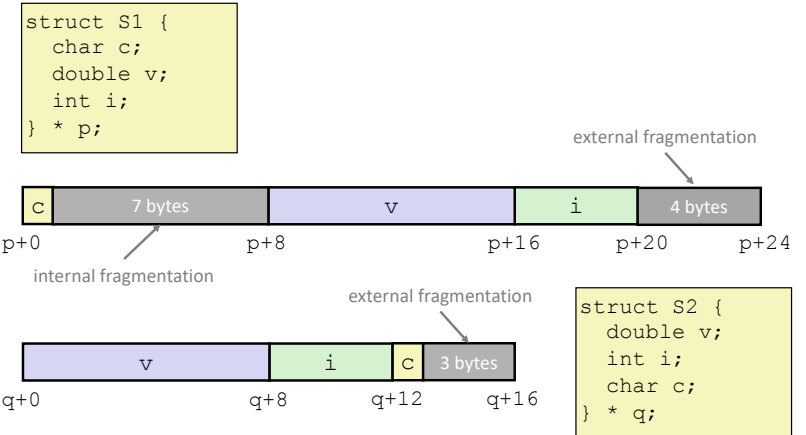

C: Struct packing

Put large data types first:

C: Struct alignment (full)

Base *and total size* must align largest internal primitive type.
Fields must align their type's largest alignment requirement.

Array in struct

```

struct rec {
  int i;
  int a[3];
  int* p;
};
  
```

Struct in array

```

struct S2 {
  double v;
  int i;
  char c;
} a[10];
  
```

C: typedef

```

// give type T another name: U
typedef T U;
  
```

```

// struct types can be verbose
struct Node { ... };
...
struct Node* n = ...;
  
```

```

// typedef can help
typedef struct Node {
  ...
} Node;
...
Node* n = ...;
  
```

Linked Lists

```
typedef
struct Node {
    struct Node* next;
    int value;
} Node;
```

ex

Implement append in x86:

```
void append(Node* head, int x) {
    // assume head != NULL
    Node* cursor = head;
    // find tail
    while (cursor->next != NULL) {
        cursor = cursor->next;
    }
    Node* n = (Node*)malloc(sizeof(Node));
    // error checking omitted
    // for x86 simplicity
    cursor->next = n;
    n->next = NULL;
    n->value = x;
}
```

Try a recursive version too.

Linked Lists

```
typedef
struct Node {
    struct Node* next;
    int value;
} Node;
```

```
append:
    pushq %rbp
    movl %esi, %ebp
    pushq %rbx
    movq %rdi, %rbx
    subq $8, %rsp
    jmp .L3
.L6:
    movq %rax, %rbx
.L3:
    movq (%rbx), %rax
    testq %rax, %rax
    jne .L6
    movl $16, %edi
    call malloc
    movq %rax, (%rbx)
    movq $0, (%rax)
    movl %ebp, 8(%rax)
    addq $8, %rsp
    popq %rbx
    popq %rbp
    ret
```

Implement append in x86:

```
void append(Node* head, int x) {
    // assume head != NULL
    Node* cursor = head;
    // find tail
    while (cursor->next != NULL) {
        cursor = cursor->next;
    }
    Node* n = (Node*)malloc(sizeof(Node));
    // error checking omitted
    // for x86 simplicity
    cursor->next = n;
    n->next = NULL;
    n->value = x;
}
```

Try a recursive version too.
