**n these exercises we take a quick look at the UDP, a streamlined, no-frills transport-layer protocol. Since you are by now a Wireshark expert this handout does not spell out the steps quite as explicitly as in earlier exercises.**

Start capturing packets in Wireshark and then do something that will cause your host to send and receive several UDP packets. It’s also likely that just by doing nothing (except capturing packets via Wireshark) that some UDP packets sent by others will appear in your trace. In particular, the Simple Network Management Protocol (SNMP - chapter 9 in the text) sends SNMP messages inside of UDP, so it’s likely that you’ll find some SNMP messages (and therefore UDP packets) in your trace.¹

After stopping packet capture, set your packet filter so that Wireshark only displays the UDP packets sent and received at your host. Pick one of these UDP packets and expand the UDP fields in the details window. Whenever possible, when answering a question below, you should hand in a printout of the packet(s) within the trace that you used to answer the question asked. Annotate the printout to explain your answer.

**Problem 1.** Select one UDP packet from your trace. From this packet, determine how many fields there are in the UDP header. (You shouldn’t look in the textbook! Answer these questions directly from what you observe in the packet trace.) Name these fields.

**Problem 2.** By consulting the displayed information in Wireshark’s packet content field for this packet, determine the length (in bytes) of each of the UDP header fields. The value in the Length field is the length of what? (You can consult the text for this answer). Verify your claim with your captured UDP packet.

**Problem 3.** What is the maximum number of bytes that can be included in a UDP payload? (Hint: the answer to this question can be determined by your answer to 2. above)

**Problem 4.** What is the largest possible source port number? (Hint: see the hint in 3.)

**Problem 5.** What is the protocol number for UDP? Give your answer in both hexadecimal and decimal notation. To answer this question, you’ll need to look into the Protocol field of the IP datagram containing this UDP segment (see Figure 4.13 in the text, and the discussion of IP header fields).

**Problem 6.** Examine a pair of UDP packets in which your host sends the first UDP packet and the second UDP packet is a reply to this first UDP packet. (Hint: For a second packet to be sent in response to a first packet, the sender of the first packet should be the destination of the second packet). Describe the relationship between the port numbers in the two packets.

¹If you saved your Wireshark sessions previous exercises, now would be a good time to haul it out.
