

# CS 251 Part 2: What's in a Type

<https://cs.wellesley.edu/~cs251/f19/>

SML and Static Types 1

## Topics

- Standard ML basics
- Static type system: types and type-checking rules

SML and Static Types 3

# Standard ML and Static Types

<https://cs.wellesley.edu/~cs251/f19/>

SML and Static Types 2

## ML: Meta-Language for Theorem-Proving

Dana Scott, 1969

**Logic of Computable Functions (LCF)**: for stating theorems about programs

Robin Milner, 1972

**Logic for Computable Functions (LCF)**: automated theorem proving for LCF

Theorem proving is a hard search problem.

**ML: Meta-Language** for writing programs (tactics) to find proofs of theorems (about other programs)

**Proof Tactic:** Partial function from formula to proof.

Guides proof search, resulting in one of:

- find and return proof
- never terminate
- report an error

SML and Static Types 5

# Language Support for Tactics

## Static type system

- guarantee correctness of generated proof

## Exception handling

- deal with tactics that fail (Turing Award)
- make failure explicit, force programmer to deal with it

## First-class/higher-order functions

- compose other tactics

SML and Static Types 6

# Defining ML

- Focus on static types.
- New syntax.
- Highly familiar semantics
  - Formal definitions only for the new/different.
  - Some of our simplifications in defining Racket match SML perfectly.
- Move faster since we share some formal experience now.

SML and Static Types 8

# An ML program is a sequence of bindings.

```
(* My first ML program *)  
  
val x = 34  
  
val y = 17  
  
val z = (x + y) + (y + 2)  
  
val q = z + 1  
  
val abs_of_z = if z < 0 then 0 - z else z  
  
val abs_of_z_simpler = abs z  
  
(* comment: ML has (* nested comments! *) *)
```

SML and Static Types 9

# Bindings, types, and environments

A program is a sequence of *bindings*.

Bindings build **two** environments:

- **static environment** maps variable to type *before evaluation*
- **dynamic environment** maps variable to value *during evaluation*

**Type-check** each binding in order:

- using **static environment** produced by previous bindings
- and extending it with a binding from variable to type

**Evaluate** each binding in order:

- using **dynamic environment** produced by previous bindings
- and extending it with a binding from variable to value

SML and Static Types 10

# SML syntax starter

Bindings

$b ::= \text{val } x = e$   
|  $\text{fun } x (x : t) = e$

Types

$t ::= \text{bool} \mid \text{int} \mid \text{real} \mid \text{string}$   
|  $(t)$  |  $t * t$  |  $t \rightarrow t$  | ...

Expressions:  $e ::= \dots$

Identifiers:  $x$

Meta-syntax

Type environments

$T ::= . \mid x : t, T$

SML and Static Types 11

# Type-checking judgments

Bindings:

$\boxed{T \vdash b \% T'}$

Under static environment  $T$ , binding  $b$  type-checks and produces extended static environment  $T'$ .

Expressions:

$\boxed{T \vdash e : t}$

Under static environment  $T$ , expression  $e$  type-checks with type  $t$ .

SML and Static Types 12

# Variable bindings

Syntax:  $\boxed{\text{val } x = e}$      $\boxed{\text{val } x = e;}$

variable name    expression

Optional semicolon can improve messages for syntax errors.

Type checking:  $\boxed{T \vdash b \% T'}$

If the expression,  $e$ , type-checks with type  $t$  under the current static environment,  $T$ , then the binding is well-typed and extends the static environment with typing  $x : t$ . 

$$\frac{T \vdash e : t}{T \vdash \text{val } x = e \% x : t, T} [\text{t-val}]$$

Evaluation (only if it type-checks):

$$\frac{\boxed{E \vdash b \% E'} \quad \boxed{E \vdash e \downarrow v}}{E \vdash \text{val } x = e \% x \mapsto v, E} [\text{e-val}]$$

SML and Static Types 13

# Expression type-checking rules

$\boxed{T \vdash e : t}$

Value examples:

$T \vdash 34 : \text{int}$

$T \vdash ~1 : \text{int}$

$T \vdash 3.14159 : \text{real}$

$T \vdash \text{true} : \text{bool}$

$T \vdash \text{false} : \text{bool}$

Variables:

Under static environment  $T$ , variable reference  $x$  type-checks with type  $t$  if the static environment maps  $x$  to  $t$ .

$$\frac{T(x) = t}{T \vdash x : t} [\text{t-var}]$$

SML and Static Types 14

## Binary expression type-checking rules

Syntax:  $e_1 + e_2$     $e_1 < e_2$   
 $e_1 = e_2$     $e_1 \neq e_2$

Type checking:  $\boxed{T \vdash e : t}$

$$\frac{\begin{array}{c} T \vdash e_1 : \text{int} \\ T \vdash e_2 : \text{int} \end{array}}{T \vdash e_1 + e_2 : \text{int}} \quad \text{[t-add]} \quad \frac{\begin{array}{c} T \vdash e_1 : \text{int} \\ T \vdash e_2 : \text{int} \end{array}}{T \vdash e_1 < e_2 : \text{bool}} \quad \text{[t-less]}$$

$$\frac{\begin{array}{c} T \vdash e_1 : t \\ T \vdash e_2 : t \end{array} \quad \text{same type}}{T \vdash e_1 = e_2 : \text{bool}} \quad \text{[t-eq]} \quad \frac{\begin{array}{c} T \vdash e_1 : t \\ T \vdash e_2 : t \end{array}}{T \vdash e_1 \neq e_2 : \text{bool}} \quad \text{[t-ne]}$$

(One more restriction later)

SML and Static Types 15

## if expressions

Syntax:  $\text{if } e_1 \text{ then } e_2 \text{ else } e_3$

Type checking:

$\boxed{T \vdash e : t}$

$$\frac{\begin{array}{c} T \vdash e_1 : \text{bool} \\ T \vdash e_2 : t \\ T \vdash e_3 : t \end{array} \quad \text{same type}}{T \vdash \text{if } e_1 \text{ then } e_2 \text{ else } e_3 : t} \quad \text{[t-if]}$$

Evaluation:

$\boxed{E \vdash e \downarrow v}$

$$\frac{\begin{array}{c} E \vdash e_1 \downarrow \text{true} \\ E \vdash e_2 \downarrow v_2 \end{array}}{E \vdash \text{if } e_1 \text{ then } e_2 \text{ else } e_3 \downarrow v_2} \quad \text{[e-if-true]}$$
  

$$\frac{\begin{array}{c} E \vdash e_1 \downarrow \text{false} \\ E \vdash e_3 \downarrow v_3 \end{array}}{E \vdash \text{if } e_1 \text{ then } e_2 \text{ else } e_3 \downarrow v_3} \quad \text{[e-if-false]}$$

SML and Static Types 16

## ML static types and evaluation

### Soundness

A program that type-checks never encounters a dynamic type error when evaluated.

### Evaluation Rules

Same as our Racket evaluation rules (for ML syntax)  
except there is no dynamic type checking.

SML and Static Types 17

## Function examples

```
(* Anonymous function expression *)
val double = fn (x : int) => x + x
val four = double (2)

(* Function binding *)
fun pow (x : int, y : int) =
  if y = 0
  then 1
  else x * pow (x,y-1)

fun cube (x : int) =
  pow (x,3)

val sixtyfour = cube (four)
val fortytwo =
  pow (2,2+2) + pow (4,2) + cube (2) + 2
```

SML and Static Types 18

## Function type syntax

$$(t_1 * \dots * t_n) \rightarrow t$$

argument types    result type

A function that takes  $n$  arguments of types  $t_1 \dots t_n$  and returns a result of type  $t$ .

SML and Static Types 19

## Anonymous function expressions

**Syntax:**  $\text{fn } (x_1 : t_1, \dots, x_n : t_n) \Rightarrow e$

argument variable names ( $x_i$ )    body expression and types ( $t_i$ )

**Type checking:**  $T \vdash e : t$

If the function body,  $e$ , type-checks with type  $t$ , under the current static environment,  $T$ , extended with the argument types, then the function type-checks with type  $(t_1 * \dots * t_n) \rightarrow t$  under the current static environment,  $T$ .

$$\frac{x_1:t_1, \dots, x_n:t_n, T \vdash e : t}{T \vdash \text{fn } (x_1:t_1, \dots, x_n:t_n) \Rightarrow e : (t_1 * \dots * t_n) \rightarrow t} \quad [\text{t-fn}]$$

function type

SML and Static Types 20

## Function bindings

**Syntax:**  $\text{fun } x_0 (x_1 : t_1, \dots, x_n : t_n) = e$

function variable name    argument variable names ( $x_i$ ) and types ( $t_i$ )    body expression

**Type checking:**  $T \vdash b \% T'$

Otherwise equivalent to  
 $\text{val } x_0 = \text{fn } (x_1 : t_1, \dots, x_n : t_n) \Rightarrow e$

↑  
    function typing (for recursion)

↑  
    argument typings

$x_1:t_1, \dots, x_n:t_n, x_0 : (t_1 * \dots * t_n) \rightarrow t, T \vdash e : t$

$T \vdash \text{fun } x_0 (x_1 : t_1, \dots, x_n : t_n) = e \% T, x_0 : (t_1 * \dots * t_n) \rightarrow t$

Evaluation: same as Racket.

SML and Static Types 21

Generalize later.

## Function application

**Syntax:**  $e_0 (e_1, \dots, e_n)$

expressions

**Type checking:**  $T \vdash e : t$

$$\frac{\begin{array}{l} T \vdash e_0 : (t_1 * \dots * t_n) \rightarrow t \\ T \vdash e_1 : t_1 \\ \dots \\ T \vdash e_n : t_n \end{array}}{T \vdash e_0 (e_1, \dots, e_n) : t} \quad [\text{t-apply}]$$

(\* Example \*)  
 $\text{fun } \text{pow } (x : \text{int}, y : \text{int}) =$   
 $\quad \text{if } y = 0$   
 $\quad \text{then } 1$   
 $\quad \text{else } x * \text{pow } (x, y-1)$

SML and Static Types 22

# Function application

Syntax:  $e_0 (e_1, \dots, e_n)$

## Evaluation:

- Under the current dynamic environment,  $\mathbf{E}$ , evaluate  $e_0$  to a function closure value  $(\mathbf{E}', \text{fn } (x_1, \dots, x_n) \Rightarrow e)$ .
  - No dynamic type-checking: Static type-checking guarantees  $e_0$ 's result value will be a function closure taking parameters  $x_1, \dots, x_n$  of types matching those of  $e_1, \dots, e_n$ .
- Under the current dynamic environment,  $\mathbf{E}$ , evaluate argument expressions  $e_1, \dots, e_n$  to values  $v_1, \dots, v_n$
- The result is the result of evaluating the closure body,  $e$ , under the closure environment,  $\mathbf{E}'$ , extended with argument bindings:  
 $x_1 \mapsto v_1, \dots, x_n \mapsto v_n$ .

SML and Static Types 23

# Function application

Syntax:  $e_0 (e_1, \dots, e_n)$

## Evaluation:

$$\frac{\begin{array}{c} \mathbf{E} \vdash e_0 \downarrow (\mathbf{E}', \text{fn } (x_1, \dots, x_n) \Rightarrow e) \\ \mathbf{E} \vdash e_1 \downarrow v_1 \\ \dots \\ \mathbf{E} \vdash e_n \downarrow v_n \\ x_1 \mapsto v_1, \dots, x_n \mapsto v_n, \mathbf{E}' \vdash e \downarrow v \end{array}}{\mathbf{E} \vdash e_0 (e_1, \dots, e_n) \downarrow v} \quad [\text{e-apply}]$$

SML and Static Types 24

# Watch out

Odd error messages for function-argument syntax errors

- \* in type syntax is not arithmetic
  - Example: `int * int -> int`
  - In expressions, \* is multiplication: `x * pow(x,y-1)`

Cannot refer to later function bindings

- Helper functions must come before their uses
- Special construct for mutual recursion (later)

SML and Static Types 25

# let expressions

... but

Syntax:  $\text{let } b \text{ in } e \text{ end}$

- $b$  is any binding and  $e$  is any expression

## Type checking:

$$\frac{\mathbf{T} \vdash b : \mathbf{T}' \quad \mathbf{T}' \vdash e : t}{\mathbf{T} \vdash \text{let } b \text{ in } e \text{ end} : t} \quad [\text{t-let}]$$

## Evaluation:

$$\frac{\mathbf{E} \vdash b \downarrow \mathbf{E}' \quad \mathbf{E}' \vdash e \downarrow v}{\mathbf{E} \vdash \text{let } b \text{ in } e \text{ end} \downarrow v} \quad [\text{e-let}]$$

SML and Static Types 26

# let is sugar

```
let val x = e1 in e2 end
```

desugars to:

```
((fn (x) => e2) e1)
```

(Rules [t-let] and [e-let] are not needed.)

Multi-binding let:

```
let b1 b2 ... bn in e end
```

Like Racket's let\*

desugars to:

```
let b1 in let b2 in ... let bn in e end ... end end
```
