Iteration/Tail Recursion 2

Factorial Revisited

```
(define (fact-rec n)
  (if (= n 0)
      1
      (* n (fact-rec (- n 1)))))
```

pending multiplication
is nontrivial glue step

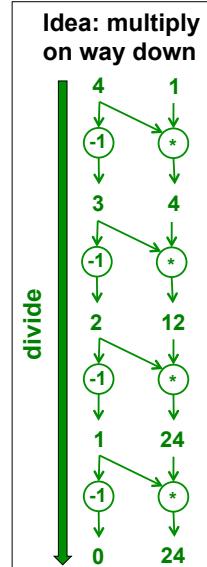

Iteration/Tail Recursion 3

Overview

- What is iteration?
- Racket has no loops, and yet can express iteration.
How can that be?
 - Tail recursion!
- Tail recursive list processing via `foldl`
- Other useful abstractions
 - General iteration via `iterate` and `iterate-apply`
 - General iteration via `genlist` and `genlist-apply`

An iterative approach to factorial

State Variables:
• `num` is the current number being processed.
• `prod` is the product of all numbers already processed.

Iteration Table:

step	num	prod
1	4	1
2	3	4
3	2	12
4	1	24
5	0	24

Iteration Rules:
• next `num` is previous `num` minus 1.
• Next `prod` is previous `num` times previous `prod`.

Iteration/Tail Recursion 4

Iterative factorial: tail recursive version

Iteration Rules:

- next num is previous num minus 1.
- next prod is previous num times previous prod.

```
(define (fact-tail num prod)
  (if (= num 0)
      prod
      (fact-tail (- num 1) (* num prod))))
```

stopping condition

```
; Here, and in many tail recursions, need a wrapper
; function to initialize first row of iteration
; table. E.g., invoke (fact-iter 4) to calculate 4!
(define (fact-iter n)
  (fact-tail n 1))
```

Iteration/Tail Recursion 5

Tail-recursive factorial: invocation tree

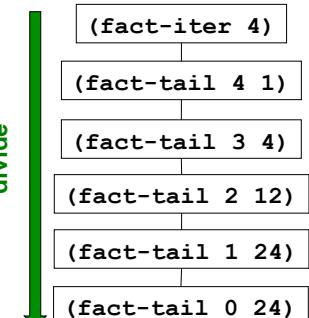

```
; Here, and in many tail recursions, need a wrapper
; function to initialize first row of iteration
; table. E.g., invoke (fact-iter 4) to calculate 4!
(define (fact-iter n)
  (fact-tail n 1))

(define (fact-tail num prod)
  (if (= num 0)
      prod
      (fact-tail (- num 1) (* num prod))))
```

Iteration Table:

step	num	prod
1	4	1
2	3	4
3	2	12
4	1	24
5	0	24

Invocation Tree:

Iteration/Tail Recursion 6

The essence of iteration in Racket

- A process is **iterative** if it can be expressed as a sequence of steps that is repeated until some stopping condition is reached.
- In divide/conquer/glue methodology, an iterative process is a recursive process with **a single subproblem and no glue step**.
- Each recursive method call is a **tail call** -- i.e., a method call with no pending operations after the call. When all recursive calls of a method are tail calls, it is said to be **tail recursive**. A tail recursive method is one way to specify an iterative process.

Iteration is so common that most programming languages provide special constructs for specifying it, known as **loops**.

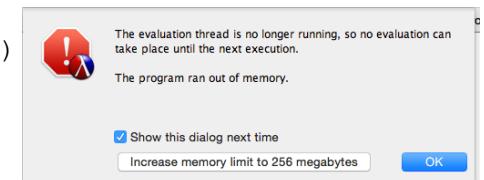

Iteration/Tail Recursion 7

inc-rec in Racket

```
; Extremely silly and inefficient recursive incrementing
; function for testing Racket stack memory limits
(define (inc-rec n)
  (if (= n 0)
      1
      (+ 1 (inc-rec (- n 1)))))
```

```
> (inc-rec 1000000) ; 10^6
1000001
```

```
> (inc-rec 10000000) ; 10^7
```

Iteration/Tail Recursion 8

inc_rec in Python

```
def inc_rec (n):
    if n == 0:
        return 1
    else:
        return 1 + inc_rec(n - 1)
```

In [16]: inc_rec(100)
Out[16]: 101

In [17]: inc_rec(1000)

...
[/Users/fturbak/Desktop/lyn/courses/cs251-archive/cs251-s16/slides-lyn-s16/racket-tail/iter.py](#) in
inc_rec(n)
 9 return 1
 10 else:
--> 11 return 1 + inc_rec(n - 1)
 12 # inc_rec(10)=> 11
 13 # inc_rec(100)=> 101

RuntimeError: maximum recursion depth exceeded

Iteration/Tail Recursion 9

inc-iter/inc-tail in Racket

```
(define (inc-iter n)
  (inc-tail n 1))

(define (inc-tail num resultSoFar)
  (if (= num 0)
      resultSoFar
      (inc-tail (- num 1) (+ resultSoFar 1))))
```

> (inc-iter 10000000) ; 10^7
10000001

> (inc-iter 100000000) ; 10^8
100000001

Will inc-iter ever run out of memory?

Iteration/Tail Recursion 10

inc_iter/int_tail in Python

```
def inc_iter (n): # Not really iterative!
    return inc_tail(n, 1)

def inc_tail(num, resultSoFar):
    if num == 0:
        return resultSoFar
    else:
        return inc_tail(num - 1, resultSoFar + 1)
```

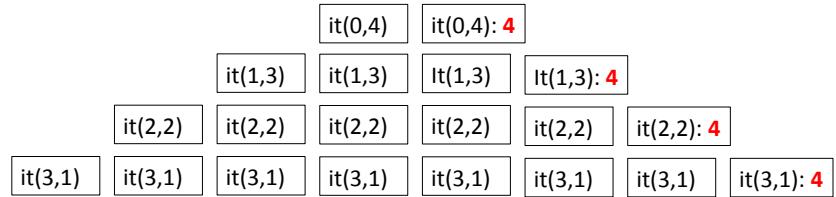

In [19]: inc_iter(100)
Out[19]: 101

In [19]: inc_iter(1000)

...
RuntimeError: maximum recursion depth exceeded

Iteration/Tail Recursion 11

Why the Difference?

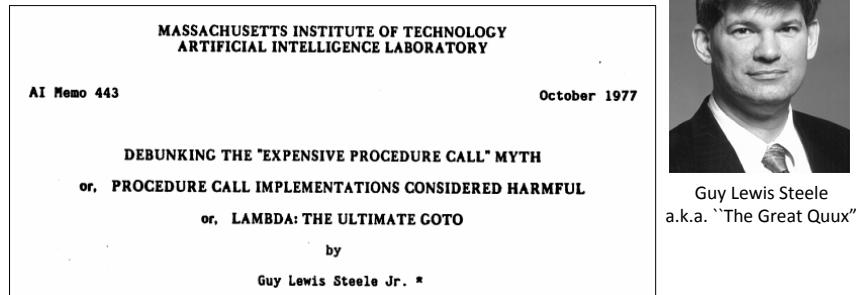

Python pushes a stack frame for every call to iter_tail. When iter_tail(0,4) returns the answer 4, the stacked frames must be popped even though no other work remains to be done coming out of the recursion.

Racket's tail-call optimization replaces the current stack frame with a new stack frame when a tail call (function call not in a subexpression position) is made. When iter-tail(0,4) returns 4, no unnecessarily stacked frames need to be popped!

Iteration/Tail Recursion 12

Origins of Tail Recursion

- One of the most important but least appreciated CS papers of all time
- Treat a function call as a GOTO that passes arguments
- Function calls should not push stack; subexpression evaluation should!
- Looping constructs are unnecessary; tail recursive calls are a more general and elegant way to express iteration.

Iteration/Tail Recursion 13

What to do in Python (and most other languages)?

In Python, **must** re-express the tail recursion as a loop!

```
def inc_loop (n):  
    resultSoFar = 0  
    while n > 0:  
        n = n - 1  
        resultSoFar = resultSoFar + 1  
    return resultSoFar
```

```
In [23]: inc_loop(1000) # 10^3  
Out[23]: 1001
```

```
In [24]: inc_loop(10000000) # 10^8  
Out[24]: 10000001
```

But Racket doesn't need loop constructs because tail recursion suffices for expressing iteration!

Iteration/Tail Recursion 14

Iterative factorial: Python `while` loop version

Iteration Rules:

- next `num` is previous `num` minus 1.
- next `prod` is previous `num` times previous `prod`.

```
def fact_while(n):  
  
    num = n } Declare/initialize local state variables  
    prod = 1 }  
  
    while (num > 0):  
        prod = num * prod } Calculate product and decrement num  
        num = num - 1 }  
  
    return prod } Don't forget to return answer!
```

Iteration/Tail Recursion 15

`while` loop factorial: Execution Land

Execution frame for `fact_while(4)`

	n	num	prod
	4	4	1
	3	3	
	2	2	12
	1	1	24
	0	0	24

num = n
prod = 1
→ `while` (num > 0):
 prod = num * prod
 num = num - 1

`return prod`

step	num	prod
1	4	1
2	3	4
3	2	12
4	1	24
5	0	24

Iteration/Tail Recursion 16

Gotcha! Order of assignments in loop body

What's wrong with the following loop version of factorial?

```
def fact_while(n):
    num = n
    prod = 1
    while (num > 0):
        num = num - 1
        prod = num * prod
    return prod
```

Moral: must think carefully about order of assignments in loop body!

Note:
tail recursion
doesn't have
this gotcha!

```
(define (fact-tail num         prod      )
       (if (= num 0)
           ans
           (fact-tail (- num 1) (* num prod))))
```

Iteration/Tail Recursion 17

Relating Tail Recursion and while loops

```
(define (fact-iter n)
  (fact-tail n 1))
```

Initialize variables

```
(define (fact-tail num prod)
  (if (= num 0)
      prod
      (fact-tail (- num 1) (* num prod))))
```

prod

(fact-tail (- num 1) (* num prod)))

```
def fact_while(n):
    num = n
    prod = 1
    while (num > 0):
        num = num - 1
        prod = num * prod
    return prod
```

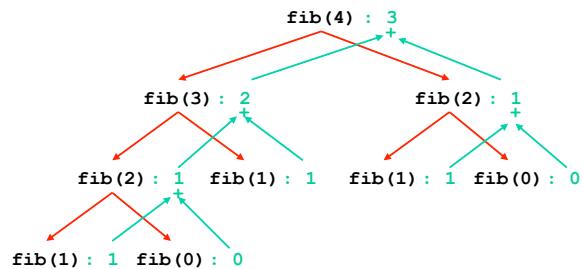

When done, return ans

While not done, update variables

Iteration/Tail Recursion 18

Recursive Fibonacci

```
(define (fib-rec n) ; returns rabbit pairs at month n
  (if (< n 2) ; assume n >= 0
      n
      (+ (fib-rec (- n 1)) ; pairs alive last month
          (fib-rec (- n 2)) ; newborn pairs
          )))
```

Iteration/Tail Recursion 19

Iteration leads to a more efficient Fib

The Fibonacci sequence: 0, 1, 1, 2, 3, 5, 8, 13, 21, ...

Iteration table for calculating the 8th Fibonacci number:

n	i	fibi	fibi+1
8	0	0	1
8	1	1	1
8	2	1	2
8	3	2	3
8	4	3	5
8	5	5	8
8	6	8	13
8	7	13	21
8	8	21	34

Iteration/Tail Recursion 20

Iterative Fibonacci in Racket

Flesh out the missing parts

```
(define (fib-iter n)
  (fib-tail n 0 0 1))

(define (fib-tail n i fibi fibi+1)
  (if (= i n)
      fibi
      (fib-tail n
                (+ i 1)
                fibi+1
                (+ fibi fibi+1))))
)
```

Iteration/Tail Recursion 21

Fixing Gotcha

1. Use a temporary variable (in general, might need $n-1$ such vars for n state variables)

```
def fib_for_fixed1(n):
    fib_i= 0
    fib_i_plus_1 = 1
    for i in range(n):
        fib_i_prev = fib_i
        fib_i = fib_i_plus_1
        fib_i_plus = fib_i_prev + fib_i_plus_1
    return fib_i
```

2. Use simultaneous assignment:

```
def fib_for_fixed2(n):
    fib_i= 0
    fib_i_plus_1 = 1
    for i in range(n):
        (fib_i, fib_i_plus_1) =\
            (fib_i_plus_1, fib_i + fib_i_plus_1)
    return fib_i
```

Iteration/Tail Recursion 23

Gotcha! Assignment order and temporary variables

What's wrong with the following looping versions of Fibonacci?

```
def fib_for1(n):
    fib_i= 0
    fib_i_plus_1 = 1
    for i in range(n):
        fib_i = fib_i_plus_1
        fib_i_plus_1 = fib_i + fib_i_plus_1
    return fib_i
```

```
def fib_for2(n):
    fib_i= 0
    fib_i_plus_1 = 1
    for i in range(n):
        fib_i_plus_1 = fib_i + fib_i_plus_1
        fib_i = fib_i_plus_1
    return fib_i
```

Moral: sometimes no order of assignments to state variables in a loop is correct and it is necessary to introduce one or more **temporary variables** to save the previous value of a variable for use in the right-hand side of a later assignment.

Or can use **simultaneous assignment** in languages that have it
(like Python!)

Iteration/Tail Recursion 22

Local fib-tail function in fib-iter

Can define fib-tail locally within fib-iter.

Since n remains constant, don't need it as an argument to local fib-tail.

```
(define (fib-iter n)
  (define (fib-tail i fibi fibi+1)
    (if (= i n)
        fibi
        (fib-tail (+ i 1)
                  fibi+1
                  (+ fibi fibi+1))))
  (fib-tail 0 0 1))
)
```

Iteration/Tail Recursion 24

Iterative List Summation

Iteration table

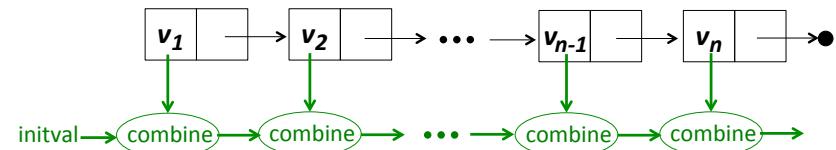

nums	sumSoFar
'(6 3 -2 5)	0
'(3 -2 5)	6
'(-2 5)	9
'(5)	-13
'()	-8

```
(define (sumList-iter L)
  (sumList-tail L 0))

(define (sumList-tail nums sumSoFar)
  (if (null? nums)
      sumSoFar
      (sumList-tail (rest nums)
                    (+ (first nums) sumSoFar))))
```

Iteration/Tail Recursion 25

Capturing list iteration via my-foldl

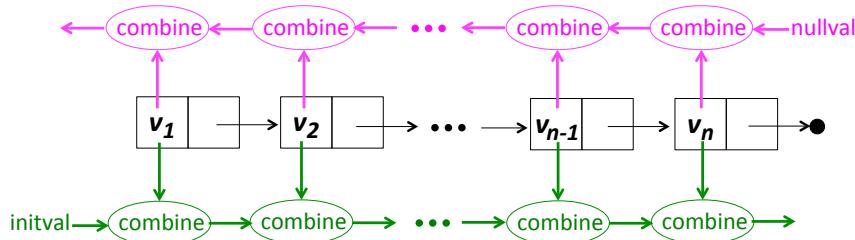

(initval is the initial resultSoFar)

```
(define (my-foldl combine resultSoFar xs)
  (if (null? xs)
      resultSoFar
      (my-foldl combiner
                (combine (first xs) resultSoFar)
                (rest xs))))
```

Iteration/Tail Recursion 26

foldr vs foldl

Iteration/Tail Recursion 27

my-foldl Examples

> (my-foldl + 0 (list 7 2 4))

13

> (my-foldl * 1 (list 7 2 4))

56

> (my-foldl cons null (list 7 2 4))

'(4 2 7)

> (my-foldl (λ (n res) (+ (* 3 res) n))

0

(list 10 -4 5 2))

251 ; = 10*3^3 + -4*3^2 + 5*3^1 + 2*3^0

; An example of Horner's method
; for polynomial evaluation

Iteration/Tail Recursion 28

Built-in Racket foldl Function Folds over Any Number of Lists

```
> (foldl cons null (list 7 2 4))  
'(4 2 7)  
  
> (foldl (λ (a b res) (+ (* a b) res))  
         0  
         (list 2 3 4)  
         (list 5 6 7))  
56  
  
> (foldl (λ (a b res) (+ (* a b) res))  
         0  
         (list 1 2 3 4)  
         (list 5 6 7))  
> ERROR: foldl: given list does not have the same  
size as the first list: '(5 6 7)
```

Same design decision
as in map and foldr

Iteration/Tail Recursion 29

What does this do?

```
(define (whatisit f xs)  
  (foldl (λ (x listSoFar)  
           (cons (f x) listSoFar))  
         null  
         xs)))
```

Ans: It performs the ``reverse map'' of function **f** on list **xs**.

E.g., (whatisit (λ (n) (* n 3)) '(7 2 4)) => '(12 6 21)

To perform a regular map, change **foldl** to **foldr**!

Iteration/Tail Recursion 31

Iterative vs Recursive List Reversal

```
(define (reverse-iter xs)  
  (foldl cons null xs))  
  
(define (snoc x ys)  
  (foldr cons (list x) ys))  
  
(define (reverse-rec xs)  
  (foldr snoc null xs))
```

How do these compare in terms of the number of conses
performed for a list of length 100? 1000? n?

Ans:

- **reverse-iter:** exactly n conses
- **snoc:** exactly n+1 conses
- **reverse-rec:** quadratic ($O(n^2)$) conses

Iteration/Tail Recursion 30

Tail Recursion Review 1

```
# Euclid's algorithm  
def gcd(a,b):  
    while b != 0:  
        temp = b  
        b = a % b  
        a = temp  
    return a
```

1. Create an iteration table for gcd(42, 72)
2. Translate Python gcd into Racket tail recursion.

a	b
42	72
72	42
42	30
30	12
12	6
6	0

```
(define (gcd a b)  
  (if (= b 0)  
      a  
      (gcd b (remainder a b))))
```

Iteration/Tail Recursion 32

Tail Recursion Review 2

```
def toInt(digits):
    i = 0
    for d in digits:
        num = 10*i + d
    return i
```

1. Create an iteration table for `toInt([1,7,2,9])`
2. Translate Python `toInt` into Racket tail recursion.
3. Translate Python `toInt` into Racket `foldl`.

<code>digits</code>	<code>i</code>
[1,7,2,9]	0
[7,2,9]	1
[2,9]	17
[9]	172
[]	1729

```
(define (toInt digits)
  (define (toIntTail ds i)
    (if (null? ds)
        i
        (toIntTail (rest ds) (+ (* 10 i) d))))
  (toIntTail digits 0))

(define (toInt digits)
  (foldl (λ (d i) (+ (* 10 i) d))
        0
        digits))
```

Iteration/Tail Recursion 33

least-power-geq

```
; Soln 1
(define (least-power-geq base threshold)
  (iterate (λ (pow) (* base pow))
          (λ (pow) (>= pw threshold))
          (λ (pow) pow)
          1)) ; Initial power

; Soln 2
(define (least-power-geq base threshold)
  (iterate (λ (exp) (+ exp 1))
          (λ (exp) (>= (expt base exp) threshold))
          (λ (exp) (expt base exp)) ; To return just exponent,
                                      ; use exp here.
          0)) ; Initial exponent

> (least-power-geq 2 10)
16
> (least-power-geq 5 100)
125
> (least-power-geq 3 100)
243
```

In Soln 2, just return `exp` rather than `(expt base exp)`

In Soln 1, change state to list of (1) power and (2) exponent. exponent is initialized to 0 and is incremented at each step. In finalization step, return exponent.

How could we return just the exponent rather than the base raised to the exponent?

Iteration/Tail Recursion 35

iterate

```
(define (iterate next done? finalize state)
```

```
  (if (done? state)
      (finalize state)
      (iterate next done? finalize
              (next state))))
```

step	<code>num</code>	<code>prod</code>
1	4	1
2	3	4
3	2	12
4	1	24
5	0	24

For example:

```
(define (fact-iterate n)
  (iterate
    (λ (num&prod)
      (list (- (first num&prod) 1)
            (* (first num&prod)
               (second num&prod))))
    (λ (num&prod) (<= (first num&prod) 0))
    (λ (num&prod) (second num&prod))
    (list n 1)))
```

step	<code>num&prod</code>
1	'(4 1)
2	'(3 4)
3	'(2 12)
4	'(1 24)
5	'(0 24)

Iteration/Tail Recursion 34

What do These Do?

```
(define (mystery1 n) ; Assume n >= 0
  (iterate (λ (ns) (cons (- (first ns) 1) ns))
          (λ (ns) (<= (first ns) 0))
          (λ (ns) ns)
          (list n)))
```

```
(define (mystery2 n)
  (iterate (λ (ns) (cons (quotient (first ns) 2) ns))
          (λ (ns) (<= (first ns) 1))
          (λ (ns) (- (length ns) 1))
          (list n)))
```

`mystery1` returns the list of ints from 0 up to and including `n`.
E.g., `(mystery1 5) => '(0 1 2 3 4 5)`

`mystery2` calculates the log-base-2 of `n` by determining how many times `n` can be divided by 2 before reaching 1. E.g.
`(mystery2 32) => 5`

Iteration/Tail Recursion 36

Using let to introduce local names

```
(define (fact-let n)
  (iterate (λ (num&prod)
    (let ([num (first num&prod)]
          [prod (second num&prod)])
      (list (- num 1) (* num prod))))
    (λ (num&prod) (≤ (first num&prod) 0))
    (λ (num&prod) (second num&prod))
    (list n 1)))
```

Iteration/Tail Recursion 37

Using match to introduce local names

```
(define (fact-match n)
  (iterate (λ (num&prod)
    (match num&prod
      [(list num prod)
       (list (- num 1) (* num prod))]))
    (λ (num&prod)
      (match num&prod
        [(list num prod) (≤ num 0)]))
    (λ (num&prod)
      (match num&prod
        [(list num prod) prod]))
    (list n 1)))
```

Iteration/Tail Recursion 38

Racket's apply

```
(define (avg a b)
  (/ (+ a b) 2))
```

```
> (avg 6 10)
8

> (apply avg '(6 10))
8

> ((λ (a b c) (+ (* a b) c)) 2 3 4)
10

> (apply (λ (a b c) (+ (* a b) c)) (list 2 3 4))
10
```

apply takes (1) a function and (2) a single argument that is a **list of values** and returns the result of applying the function to the values.

Iteration/Tail Recursion 39

iterate-apply: a kinder, gentler iterate

```
(define (iterate-apply next done? finalize state)
  (if (apply done? state)
    (apply finalize state)
    (iterate-apply next done? finalize
      (apply next state))))
```

```
(define (fact-iterate-apply n)
  (iterate-apply
    (λ (num prod)
      (list (- num 1) (* num prod)))
    (λ (num prod) (≤ num 0))
    (λ (num prod) prod)
    (list n 1)))
```

step	num	prod
1	4	1
2	3	4
3	2	12
4	1	24
5	0	24

Iteration/Tail Recursion 40

iterate-apply: fib and gcd

it's
your
turn

```
(define (fib-iterate-apply n)
  (iterate-apply
    (λ (i fibi fibi+1) ; next
      (list (+ i 1) fibi+1 (+ fibi fibi+1)))
    (λ (i fibi fibi+1) (= i n)) ; done?
    (λ (i fibi fibi+1) fibi) ; finalize
    (list 0 0 1) ; init state
  ))
```

n	i	fibi	fibi+1
8	0	0	1
8	1	1	1
8	2	1	2
8	3	2	3
8	4	3	5
8	5	5	8
8	6	8	13
8	7	13	21
8	8	21	34

```
(define (gcd-iterate-apply a b)
  (iterate-apply
    (lambda (a b) ; next
      (list b (remainder a b)))
    (lambda (a b) (= b 0)) ; done?
    (lambda (a b) a) ; finalize
    (list a b))) ; init state
  ))
```

a	b
42	72
72	42
42	30
30	12
12	6
6	0

Iteration/Tail Recursion 41

Simple genlist examples

it's
your
turn

What are the values of the following calls to genlist?

```
(genlist (λ (n) (- n 1))
         (λ (n) (= n 0))
         #t
         5)
```

'(5 4 3 2 1 0)

```
(genlist (λ (n) (- n 1))
         (λ (n) (= n 0))
         #f
         5)
```

'(5 4 3 2 1)

```
(genlist (λ (n) (* n 2))
         (λ (n) (> n 100))
         #t
         1)
```

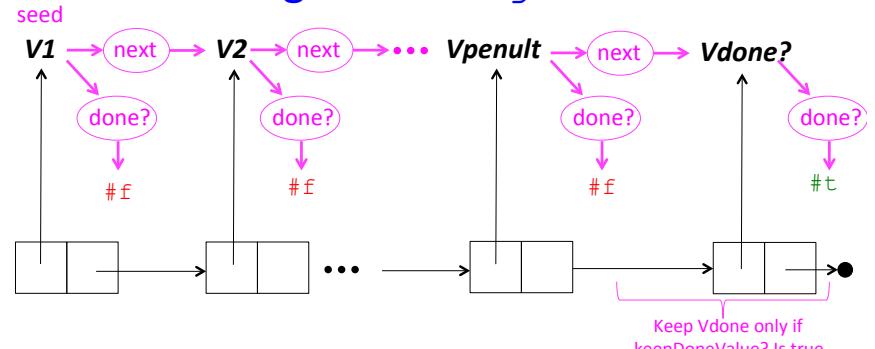

'(1 2 4 8 16 32 64 128)

```
(genlist (λ (n) (* n 2))
         (λ (n) (> n 100))
         #f
         1)
```

'(1 2 4 8 16 32 64)

Iteration/Tail Recursion 43

Creating lists with genlist

(define (genlist next done? keepDoneValue? seed)

```
(if (done? seed)
  (if keepDoneValue? (list seed) null)
  (cons seed
    (genlist next done? keepDoneValue? (next seed))))
```

not iterative as written, but next function gives iterative "flavor"

Iteration/Tail Recursion 42

genlist: my-range and halves

(my-range **lo hi**)

```
> (my-range 10 15)
'(10 11 12 13 14)
```

(halves **num**)

```
> (halves 64)
'(64 32 16 8 4 2 1)
```

> (halves 42)
'(42 21 10 5 2 1)

> (halves -63)
'(-63 -31 -15 -7 -3 -1)

(define (my-range-genlist lo hi)

```
(genlist
  (λ (n) (+ n 1)) ; next
  (λ (n) (>= n hi)) ; done?
  #f ; keepDoneValue?
  lo ; seed
))
```

(define (halves num)

```
(genlist
  (λ (n) (quotient n 2)) ; next
  (λ (n) (= n 0)) ; done?
  #f ; keepDoneValue?
  num ; seed
))
```

Iteration/Tail Recursion 44

Using genlist to generate iteration tables

```
(define (fact-table n)
  (genlist (λ (num&prod)
    (let ((num (first num&ans))
          (prod (second num&ans)))
      (list (- num 1) (* num prod))))
    (λ (num&prod) (<= (first num&prod) 0))
    #t
    (list n 1)))
```

step	num	prod
1	4	1
2	3	4
3	2	12
4	1	24
5	0	24

```
> (fact-table 4)
'((4 1) (3 4) (2 12) (1 24) (0 24))
> (fact-table 5)
'((5 1) (4 5) (3 20) (2 60) (1 120) (0 120))
```

45

```
> (fact-table 10)
'((10 1)
 (9 10)
 (8 90)
 (7 720)
 (6 5040)
 (5 30240)
 (4 151200)
 (3 604800)
 (2 1814400)
 (1 3628800)
 (0 3628800))
```

it's
your
turn

```
(define (sum-list-table ns)
  (genlist
    (λ (nums&sum)
      (let {[nums (first nums&ans)]
            [sum (second nums&ans)]}
        (list (rest nums)
              (+ sum (first nums)))))
    (λ (nums&sum)
      (null? (first nums&sum)))
    #t
    (list ns 0)))
  )
```

```
> (sum-list-table '(7 2 5 8 4))
'(((7 2 5 8 4) 0)
 ((2 5 8 4) 7)
 ((5 8 4) 9)
 ((8 4) 14)
 ((4) 22)
 ((0) 26))
```

Iteration/Tail Recursion 46

genlist can collect iteration table column!

```
; With table abstraction
(define (partial-sums ns)
  (map second (sum-list-table ns)))
```

```
; Without table abstraction
(define (partial-sums ns)
  (map second
    (genlist (λ (nums&sum)
      (let ((nums (first nums&ans))
            (sum (second nums&ans)))
        (list (rest nums) (+ (first nums) sum))))
      (λ (nums&sum) (null? (first nums&sum)))
      #t
      (list ns 0))))
```

```
> (partial-sums '(7 2 5 8 4))
'(0 7 9 14 22 26)
```

Moral: ask yourself the question
 "Can I generate this list as the column of an iteration table?"

Iteration/Tail Recursion 47

genlist-apply: a kinder, gentler genlist

```
(define (genlist-apply next done? keepDoneValue? seed)
  (if (apply done? seed)
    (if keepDoneValue? (list seed) null)
    (cons seed
      (genlist-apply next done? keepDoneValue?
                    (apply next seed)))))
```

Example:

```
(define (partial-sums ns)
  (map second
    (genlist-apply
      (λ (nums ans)
        (list (rest nums) (+ (first nums) ans)))
      (λ (nums ans) (null? nums)))
      #t
      (list ns 0))))
```

Iteration/Tail Recursion 48

partial-sums-between

```
(define (partial-sums-between lo hi)
  (map second
    (genlist-apply
      (λ (num sum) ; next
        (list (+ num 1) (+ num sum)))
      (λ (num sum) ; done?
        (> num hi))
      #t ; keepDoneValue?
      (list lo 0) ; seed
    )))
```

```
> (partial-sums-between 3 7)
'(0 3 7 12 18 25)

> (partial-sums-between 1 10)
'(0 1 3 6 10 15 21 28 36 45 55)
```

Iteration/Tail Recursion 49

Iterative Version of genlist

```
; Returns the same list as genlist, but requires only
; constant stack depth (*not* proportional to list length)
(define (genlist-iter next done? keepDoneValue? seed)
  (iterate-apply
    (λ (state reversedStatesSoFar)
      (list (next state)
            (cons state reversedStatesSoFar)))
    (λ (state reversedStatesSoFar) (done? state))
    (λ (state reversedStatesSoFar)
      (if keepDoneValue?
          (reverse (cons state reversedStatesSoFar))
          (reverse reversedStatesSoFar)))
    (list seed '()))))
```

Example: How does this work?

```
(genlist-iter (λ (n) (quotient n 2))
              (λ (n) (≤ n 0))
              5)
```

Iteration/Tail Recursion 50

Iterative Version of genlist-apply

```
(define (genlist-apply-iter next done? keepDoneValue? seed)
  (iterate-apply
    (λ (state reversedStatesSoFar)
      (list (apply next state)
            (cons state reversedStatesSoFar)))
    (λ (state reversedStatesSoFar) (apply done? state))
    (λ (state reversedStatesSoFar)
      (if keepDoneValue?
          (reverse (cons state reversedStatesSoFar))
          (reverse reversedStatesSoFar)))
    (list seed '()))))
```

Iteration/Tail Recursion 51
