Department of Computer Science
Wellesley College

SML lists are homogeneous

Unlike in Racket & Python, all elements of an SML list must have the same type.

```
- 1 :: [2,3,4];
val it = [1,2,3,4] : int list

- op:: (1, [2,3,4]); (* op:: is prefix version of infix :: *)
val it = [1,2,3,4] : int list

-op:: ;
val it = fn : 'a * 'a list -> 'a list

- "a" :: [1,2,3];
stdIn:1.1-8.3 Error: operator and operand don't agree [literal]
  operator domain: string * string list
  operand:          string * int list
  in expression:
  "a" :: 1 :: 2 :: 3 :: nil

-[1,2] :: [3,4,5];
stdIn:9.1-9.17 Error: operator and operand don't agree [literal]
  operator domain: int list * int list list
  operand:          int list * int list
  in expression:
  (1 :: 2 :: nil) :: 3 :: 4 :: 5 :: nil
```

List Processing in SML 3

Consing Elements into Lists

```
- val nums = 9 :: 4 :: 7 :: [];
val nums = [9,4,7] : int list

- 5 :: nums;
val it = [5,9,4,7] : int list

- nums;
val it = [9,4,7] : int list (* nums is unchanged *)

- (1+2) :: (3*4) :: (5-6) :: [];
val it = [3,12,~1] : int list

- [1+2, 3*4, 5-6];
val it = [3,12,~1] : int list

- [1=2, 3 < 4, false];
val it = [false, true, false] : bool list

- ["I", "do", String.substring ("note",0,3), "li" ^ "ke"];
val it = ["I", "do", "not", "like"] : string list

- [(#"a", 8), (#"z", 5)];
val it = [(#"a",8),(#"z",5)] : (char * int) list

- [[7,2,5], [6], 9::[3,4]];
val it = [[7,2,5],[6],[9,3,4]] : int list list
```

List Processing in SML 2

Tuples vs. Lists

Tuples are heterogeneous fixed-length product types:

```
- (1+2, 3=4, "foo" ^ "bar", String.sub ("baz", 2));
val it = (3,false,"foobar",#"z") : int * bool * string * char
```

List are homogeneous variable-length product types:

```
- [1, 2+3, 4*5, 6-7, 8 mod 3];
val it = [1,5,20,~1,2] : int list

- [1=2, 3<4];
val it = [false,true] : bool list

- ["foo", "bar" ^ "baz", String.substring ("abcdefg", 2, 3)];
val it = ["foo","barbaz","cde"] : string list

- [#"a", String.sub("baz", 2), chr(100)];
- val it = [#"a",#"z",#"d"] : char list
```

List Processing in SML 4

Some Simple List Operations

```
- List.length [7,3,6,1];
val it = 4 : int

- List.hd [7,3,6,1]; use pattern matching instead
val it = 7 : int

- List.tl [7,3,6,1];
val it = [3,6,1] : int list

- List.take ([7,3,6,1],2);
val it = [7,3] : int list

- List.take ([7,3,6,1],3);
val it = [7,3,6] : int list

- List.drop ([7,3,6,1],2);
val it = [6,1] : int list

- List.drop ([7,3,6,1],3);
val it = [1] : int list
```

(* An API for all SMLNJ List operations can be found at:
<http://www.standardml.org/Basis/list.html> *)

List Processing in SML 5

Appending Lists

```
- [7,2] @ [8,1,6];
val it = [7,2,8,1,6] : int list

- [7,2] @ [8,1,6] @ [9] @ [];
val it = [7,2,8,1,6,9] : int list

(* Appending is different than consing! *)
- [7,2] :: [8,1,6] :: [9] :: [];
val it = [[7,2],[8,1,6],[9]] : int list list

- op::: (* prefix cons function *)
val it = fn : 'a * 'a list -> 'a list

- op@; (* prefix append function *)
val it = fn : 'a list * 'a list -> 'a list

(* List.concat appends all elts in a list of lists *)
- List.concat [[7,2],[8,1,6],[9]];
val it = [7,2,8,1,6,9] : int list

- List.concat;
val it = fn : 'a list list -> 'a list
```

List Processing in SML 6

Pattern Matching on Lists

```
(* matchtest : (int * int) list -> (int * int) list *)
fun matchtest xs =
  case xs of
    [] => []
  | [(a,b)] => [(b,a)]
  | (a,b) :: (c,d) :: zs => (a+c,b*d) :: (c,d) :: zs

- matchtest [];
val it = [] : (int * int) list

- matchtest [(1,2)];
val it = [(2,1)] : (int * int) list

- matchtest [(1,2),(3,4)];
val it = [(4,8),(3,4)] : (int * int) list

- matchtest [(1,2),(3,4),(5,6)];
val it = [(4,8),(3,4),(5,6)] : (int * int) list
```

List Processing in SML 7

Other Pattern-Matching Notations

```
fun matchtest2 xs =
  case xs of
    [] => []
  | [(a,b)] => [(b,a)]
  | (a,b) :: (ys as ((c,d) :: zs)) => (a+c,b*d) :: ys
    (* subpatterns can be named with "as" *)
```

```
fun matchtest3 [] = []
  | matchtest3 [(a,b)] = [(b,a)]
  | matchtest3 ((a,b) :: (ys as ((c,d) :: zs)))
    (* parens around pattern necessary above *)
    = (a+c,b*d) :: ys
```

List Processing in SML 8

List Accumulation

```
(* Recursively sum a list of integers *)
(* sumListRec : int list -> int *)
fun sumListRec [] =
| sumListRec (x::xs) =
```

```
- sumListRec [];
val it = 0 : int
```

```
- sumListRec [5,2,4];
val it = 11 : int
```

```
(* Iterative (tail-recursive) summation *)
fun sumListIter xs =
  let fun loop [] sum =
    | loop (y::ys) sum =
      in loop xs 0
    end
```

```
- sumListIter [5,2,4];
val it = 11 : int
```

List Processing in SML 9

SML's map

```
- map (* Same as List.map; available at top-level *)
val it = fn : ('a -> 'b) -> 'a list -> 'b list

- map (fn x => x + 1) [5,2,4];
val it =           : int list

- map (fn y => y * 2) [5,2,4];
val it =           : int list

- map (fn z => z > 3) [5,2,4];
val it =           : bool list

- map (fn a => (a, (a mod 2) = 0)) [5,2,4];
val it =           : (int * bool) list

- map (fn s => s ^ "side") ["in", "out", "under"];
val it =           : string list

- map (fn xs => 6::xs) [[7,2],[3],[8,4,5]];
val it =           : int list list
```

List Processing in SML 11

Your turn: sumProdList in SML

Given a list of numbers, sumProdList returns a pair of
(1) the sum of the numbers in the list and
(2) The product of the numbers in the list

```
- sumProdList [];
val it = (0,1) : int * int
- sumProdList [5,4,2,3];
val it = (14,120) : int * int
```

Define sumProdList in SML. Use **let val** in your definition to avoid exponential blowup.

List Processing in SML 10

SML's List.filter

```
- List.filter; (* *must* be qualified as List.filter *)
val it = fn : ('a -> bool) -> 'a list -> 'a list

- List.filter (fn x => x > 0) [3, ~7, ~6, 8, 5];
val it =           : int list

- List.filter (fn y => (y mod 2) = 0) [5,2,4,1];
val it =           : int list

- List.filter (fn s => (String.size s) <= 3)
=  ["I","do","not","like","green","eggs","and","ham"];
val it =           : string list

- List.filter (fn xs => (sumListRec xs > 10)) [[7,2],[3],
[8,4,5]];
val it =           : int list list
```

List Processing in SML 12

Some Other Higher-Order List Ops

```
(* List.partition : ('a -> bool) -> 'a list -> 'a list * 'a list
   splits a list into two: those elements that satisfy the
   predicate, and those that don't *)
- List.partition (fn x => x > 0) [3, ~7, ~6, 8, 5];
val it = ([3,8,5],[~7,~6]) : int list * int list

- List.partition (fn y => (y mod 2) = 0) [5,2,4,1];
val it = ([2,4],[5,1]) : int list * int list

(* List.all : ('a -> bool) -> 'a list -> bool returns true iff
   the predicate is true for all elements in the list. *)
- List.all (fn x => x > 0) [5,2,4,1];
val it = true : bool

- List.all (fn y => (y mod 2) = 0) [5,2,4,1];
val it = false : bool

(* List.exists : ('a -> bool) -> 'a list -> bool returns true iff
   the predicate is true for at least one element in the list. *)
- List.exists (fn y => (y mod 2) = 0) [5,2,4,1];
val it = true : bool

- List.exists (fn z => z < 0) [5,2,4,1];
val it = false : bool
```

List Processing in SML 13

Zipping in SML

```
(* 'a list * 'b list -> ('a * 'b) list *)
(* Note that input is a *tuple* of lists! *)
- ListPair.zip (["a","b","c"],[1,2,3,4]);
val it = [("a",1),("b",2),("c",3)] : (string * int) list

(* ('a * 'b) list -> 'a list * 'b list *)
- ListPair.unzip [(“a”,1), (“b”,2), (“c”,3)];
val it = (["a","b","c"],[1,2,3]) : string list * int
list
```

(* An API for all SMLNJ ListPair operations can be found
at: <http://www.standardml.org/Basis/list-pair.html> *)

List Processing in SML 14

foldr : The Mother of All List Recursions

```
- List.foldr; (* Same as List.foldr; available at top-level *)
  (* Note that combiner takes *tupled* args! *)
val it = fn : ('a * 'b -> 'b) -> 'b -> 'a list -> 'b

- List.foldr (fn (x,y) => x + y) 0 [5,2,4];
val it =      : int

- List.foldr op+ 0 [5,2,4];
val it =      : int

- List.foldr (fn (x,y) => x * y) 1 [5,2,4];
val it =      : int

- List.foldr (fn (x,y) => x andalso y) true [true,false,true];
val it =      : bool

- List.foldr (fn (x,y) => x andalso y) true [true,true,true];
val it =      : bool

- List.foldr (fn (x,y) => x orelse y) false [true,false,true];
val it =      : bool

- List.foldr (fn (x,y) => (x > 0) andalso y) true [5,2,4];
val it =      : bool

- List.foldr (fn (x,y) => (x < 0) orelse y) false [5,2,4];
val it =      : bool
```

List Processing in SML 15

foldl : The Mother of All List Iterations

```
- List.foldl; (* Same as List.foldl; available at top-level *)
  (* Note that combiner takes *tupled* args! *)
val it = fn : ('a * 'b -> 'b) -> 'b -> 'a list -> 'b

- List.foldl op+ 0 [5,2,4];
val it =      : int

- List.foldl op* 1 [5,2,4];
val it =      : int

- List.foldl op:: [] [8,5,2,4];
val it =      : int list

- List.foldr op:: [] [8,5,2,4];
val it =      : int list

- List.foldl (fn (bit, sumSoFar) => 2*sumSoFar + bit) 0 [1, 0, 1, 0];
val it =      : int

- List.foldl (fn (bit, sumSoFar) => 2*sumSoFar + bit) 0
= [1, 1, 1, 1, 1, 0, 1, 1];
val it =      : int
```

List Processing in SML 16

Your turn with SML's higher-order ops 1

```
fun sumSquaresEvens ns = (* use foldr, map, List.filter *)
```

```
- sumSquaresEvens [7, 6, ~2, ~9, 10];
val it = 140 : int
```

```
fun sumProdList ns = (* use foldr *)
```

```
- sumProdList [5,4,2,3];
val it = (14,120) : int * int
```

List Processing in SML 17

Your turn with SML's higher-order ops 2

```
fun myReverse xs = (* use List.foldl *)
```

```
- myReverse [7, 6, ~2, ~9, 10];
val it = [10,~9,~2,6,7] : int list
```

```
fun consecutiveProds ns = (* use map, List.zip *)
```

```
- consecutiveProds [7, 6, ~2, ~9, 10];
val it = [42,~12,18,~90] : int list
```

List Processing in SML 18
