## What do words mean?

N -gram or text classification methods we've seen so far

- Words are just strings (or indices $w_{i}$ in a vocabulary list)
- That's not very satisfactory!

Formal semantics:

- The meaning of "dog" is DOG; cat is CAT

$$
\forall x \operatorname{DOG}(x) \longrightarrow \operatorname{MAMMAL}(x)
$$

Old linguistics joke by Barbara Partee:

- Q: What's the meaning of life?
- A: LIFE

Desiderata

What should a theory of word meaning do for us?
What wares are similar?
whet words wave opposite meanings?
What wards are related?
what words show op where?

## Lemmas and senses

lemma
mouse ( N )
sense

1. any of numerous small rodents...
2. a hand-operated device that controls a cursor...

A sense or "concept" is the meaning component of a word Lemmas can be polysemous (have multiple senses)

## Relations between senses: Synonymy

Synonyms have the same meaning in some or all contexts.

- filbert / hazelnut
- couch / sofa
- big / large
- automobile / car
- vomit / throw up
- water / $\mathrm{H}_{2} \mathrm{O}$

$$
\begin{aligned}
& \text { connotation }=\text { "style" } \\
& \text { denotation }=\text { many }
\end{aligned}
$$

## The Linguistic Principle of Contrast:

 Difference in form $\rightarrow$ difference in meaningAbbé Gabriel Girard (1718):
" j e ne crois pas qu'il y air demor fynonime dans aucune Langue te le dis par con-"
[I do not believe that there is a synonymous word in any language]

LA' JUSTESSE DE LA

LANGUE FRANȨOISE.

Ov | LES DFERENTES SIGNIFICATIONS |
| :---: |
| DESMOTS QUIPASSENT |
| DOUR |.

SYNONIMES.
Dar M.l'Albé GIRARD C.D. M. D.D.B.
A. PARIS

Chez I. aurent d'Houry, Imprimeur-L-braire, aú bas de la rue dela Harpe, visà vis la rue $S$. Scverin!, au Saint Efprir.

## Relation: Synonymy?

water/ $/ \mathrm{H}_{2} \mathrm{O}$
" $\mathrm{H}_{2} \mathrm{O}$ " in a surfing guide?
big/large
my big sister != my large sister

## Relation: Similarity

Words with similar meanings.
Not synonyms, but sharing some element of meaning:
car, bicycle
cow, horse

## Ask humans how similar 2 words are

| word1 | word2 | similarity |  |  |
| :--- | :--- | :---: | :---: | :---: |
| vanish | disappear | 10 | 6.5 | 9 |
| behave | obey | 7 | 6 | 5 |
| belief | impression | 4 | 4 | 5 |
| muscle | bone | 3 | 6 | 5 |
| modest | flexible | 0 | 5 | 2 |
| hole | agreement | 2 | 0 | 0.5 |

## Relation: Word relatedness

Also called "word association"
Words can be related in any way, perhaps via a semantic frame or field

- coffee, tea: similar
- movie, popcorn: related, not similar

## Semantic field

Words that

- cover a particular semantic domain
- bear structured relations with each other.
hospitals
surgeon, scalpel, nurse, anaesthetic, hospital
restaurants
waiter, menu, plate, food, menu, chef
houses
door, roof, kitchen, family, bed

## Connotation

## We usually consider 3 affective dimensions:

- valence: the pleasantness of the stimulus
- arousal: the intensity of emotion provoked by the stimulus
- dominance: the degree of control exerted by the stimulus

|  | Word | Score |  | Word | Score |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Valence | love | 1.000 | toxic | 0.008 |  |
| Arousal | happy | 1.000 | nightmare | 0.005 |  |
|  | elated | 0.960 | mellow | 0.069 |  |
|  | frenzy | 0.965 | napping | 0.046 |  |
|  | powerful | 0.991 | weak | 0.045 |  |
|  | leadership | 0.983 | empty | 0.081 |  |

## Desiderata

## Concepts or word senses

- Have a complex many-to-many association with words (homonymy, multiple senses)
Have relations with each other
- Synonymy
- Antonymy
- Similarity
- Relatedness
- Connotation

## Vector Semantics

Vector
Semantics \& Embeddings

Computational models of word meaning

Can we build representions of word meanings?
Most common approach: vector semantics
marmot: $\quad[0.3,1,5,-1,-2.5,4,10,15]$

## Ludwig Wittgenstein

PI \#43:
"The meaning of a word is its use in the language"

## Let's define words by their usages

One way to define "usage":
words are defined by their environments (the words around them)

Zellig Harris (1954):
If $A$ and $B$ have almost identical environments we say that they are synonyms.

## What does recent English borrowing ongchoi mean?

Suppose you see these sentences:

- Ong choi is delicious sautéed with garlic.
- Ong choi is superb over rice
- Ong choi leaves with salty sauces

And you've also seen these:

- ...spinach sautéed with garlic over rice
- Chard stems and leaves are delicious
- Collard greens and other salty leafy greens

Conclusion:

- Ongchoi is a leafy green like spinach, chard, or collard greens
- We could conclude this based on words like "leaves" and "delicious" and "sauteed"

## Ongchoi：Ipomoea aquatica＂Water Spinach＂

## 空心菜

kangkong
rau muống

Idea 1: Defining meaning by linguistic distribution
Let's define the meaning of a word by its distribution in language use, meaning its neighboring words or grammatical environments.

## Idea 2: Meaning as a point in space (Osgood et al. 1957)

## 3 affective dimensions for a word

- valence: pleasantness
- arousal: intensity of emotion
- dominance: the degree of control exerted

|  | Word | Score | Word | Score |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Valence | love | 1.000 | toxic | 0.008 |
| Arousal | happy | 1.000 | nightmare | 0.005 |
|  | elated | 0.960 | mellow | 0.069 |
| Dominance | frenzy | 0.965 | napping | 0.046 |
|  | powerful | 0.991 | weak | 0.045 |
|  | leadership | 0.983 | empty | 0.081 |

NRC VAD Lexicon
(Mohammad 2018)

Hence the connotation of a word is a vector in 3-space

Idea 1: Defining meaning by linguistic distribution
Idea 2: Meaning as a point in multidimensional space

Defining meaning as a point in space based on distribution

## Each word = a vector (not just "good" or " $\mathrm{w}_{45}$ ")

Similar words are "nearby in semantic space"
We build this space by seeing which words are nearby in text

very good incredibly good
amazing
terrific
fantastic wonderful

## How to represent word meaning numerically?

Idea: represent each word using a vector.
These vectors are called "embeddings" because they are embedded into a space.

The standard way to represent meaning in NLP
Every modern NLP algorithm uses embeddings as the representation of word meaning
Fine-grained model of meaning for similarity

## Intuition: why vectors?

Consider sentiment analysis:

- With words, a feature is a word identity
- Feature 5: 'The previous word was "terrible"'
- requires exact same word to be in training and test
- With embeddings:
- Feature is a word vector
- 'The previous word was vector [35,22,17...]
- Now in the test set we might see a similar vector [34,21,14]
- We can generalize to similar but unseen words!!!

## We'll discuss 2 kinds of embeddings

tf-idf

- Information Retrieval workhorse!
- A common baseline model
- Sparse vectors
- Words are represented by (a simple function of) the counts of nearby words

Word2vec

- Dense vectors
- Representation is created by training a classifier to predict whether a word is likely to appear nearby
- Later we'll discuss extensions called contextual embeddings

Vector
Semantics \& Embeddings

## Words and Vectors

## Term-document matrix

Each document is represented by a vector of words

|  | Emma | Persuasion | Sense \& Sensibility |
| :---: | :---: | :---: | :---: |
| admiral | 0 | 69 | 0 |
| dance | 49 | 11 | 21 |
| admire | 31 | 14 | 18 |
| horse | 40 | 15 | 24 |

## Visualizing document vectors

## Vectors are the basis of information retrieval

|  | Emma | Persuasion | Sense \& Sensibility | Paradise Lost |
| :---: | :---: | :---: | :---: | :---: |
| admiral | 0 | 69 | 0 | 0 |
| dance | 49 | 11 | 21 | 27 |
| admire | 31 | 14 | 18 | 11 |
| horse | 40 | 15 | 24 | 5 |

## Idea for word meaning: Words can be vectors too!!!

|  | Emma | Persuasion | Sense \& Sensibility | Paradise Lost |
| :---: | :---: | :---: | :---: | :---: |
| admiral | 0 | 69 | 0 | 0 |
| dance | 49 | 11 | 21 | 27 |
| admire | 31 | 14 | 18 | 11 |
| horse | 40 | 15 | 24 | 5 |

## More common: word-word matrix (or "term-context matrix")

Two words are similar in meaning if their context vectors are similar
is traditionally followed by cherry pie, a traditional dessert often mixed, such as strawberry rhubarb pie. Apple pie computer peripherals and personal digital assistants. These devices usually a computer. This includes information available on the internet

|  | aardvark | $\ldots$ | computer | data | result | pie | sugar | $\ldots$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| cherry | 0 | $\ldots$ | 2 | 8 | 9 | 442 | 25 | $\ldots$ |
| strawberry | 0 | $\ldots$ | 0 | 0 | 1 | 60 | 19 | $\ldots$ |
| digital | 0 | $\ldots$ | 1670 | 1683 | 85 | 5 | 4 | $\ldots$ |
| information | 0 | $\ldots$ | 3325 | 3982 | 378 | 5 | 13 | $\ldots$ |

Vector
Semantics \& Embeddings

Computing word similarity

Computing word similarity: Dot product and cosine

The dot product between two vectors is a scalar:

$$
\operatorname{dot} \text { product }(v, w)=v \cdot w=\sum_{i=1}^{N} v_{i} w_{i}=v_{1} w_{1}+\ldots+v_{N} w_{N}
$$

Big when 2 vectors have the same valves in the same dimensions

## Problem with raw dot-product

Dot product is higher if a vector is longer (has high values in many dimensions).

Vector length:

$$
|v|=\sqrt{\sum_{i=1}^{N} v_{i}^{2}}
$$

## Solution: normalize by vector length

Vector length:

$$
\sqrt{\sum_{i=1}^{N} v_{i}^{2}}
$$

Normalized dot product:

$$
\frac{v \cdot w}{|v||w|}=
$$

$$
\frac{\sum_{i=1}^{N} v_{i} w_{i}}{\sqrt{\sum_{i=1}^{N} v_{i}^{2} \sqrt{\sum_{i=1}^{N} w_{i}^{2}}}}
$$

## Surprise!

This is the cosine of the angle between the two vectors!

$$
\operatorname{cosine}(\mathbf{v}, \mathbf{w})=\frac{\mathbf{v} \cdot \mathbf{w}}{|\mathbf{v}||\mathbf{w}|}=\frac{\sum_{i=1}^{N} v_{i} w_{i}}{\sqrt{\sum_{i=1}^{N} v_{i}^{2}} \sqrt{\sum_{i=1}^{N} w_{i}^{2}}}
$$

## Cosine as a similarity metric

-1 : vectors point in opposite directions
+1: vectors point in same directions
0: vectors are orthogonal

But since raw frequency values are non-negative, the cosine for term-term matrix vectors ranges from 0-1

## Cosine examples

|  | pie | data | computer |
| :---: | :---: | :---: | :---: |
| cherry | 442 | 8 | 2 |
| digital | 5 | 1683 | 1670 |
| information | 5 | 3982 | 3325 |

$\cos ($ cherry ,information $)=$ $\cos ($ digital, information $)=$

## Visualizing cosine similarity

500

digital
information
$\begin{array}{llllll}500 & 1000 & 1500 & 2000 & 2500 & 3000\end{array}$
Dimension 2: 'computer'

# Vector <br> Semantics \& Embeddings 

Term Frequency - Inverse Document Frequency (TF-IDF)

## Take another look at our Austen word frequencies:

|  | Emma | Persuasion | Sense \& Sensibility |
| :---: | :---: | :---: | :---: |
| admiral | 0 | 69 | 0 |
| dance | 49 | 11 | 21 |
| admire | 31 | 14 | 18 |
| horse | 40 | 15 | 24 |

## Raw frequency is a bad representation

- Word counts for Emma are generally higher because it is a longer novel.
- Another issue: some words are so frequent that they aren't very informative: the, it, or they

Solution 1: tf-idf
tf-idf: Term Frequency - Inverse Document Frequency

Term Frequency:

$$
t f_{t, d}=\operatorname{cosht}(t, d)
$$

Inverse Document Frequency:

$$
\begin{array}{r}
i d f_{t}=\frac{N}{d f_{t}} \quad \begin{array}{c}
N=\# \text { of } \\
\text { documents }
\end{array} \\
d f_{t}=\begin{array}{c}
\text { cont of docurnts } \\
\text { in which } t \\
\text { occurs }
\end{array}
\end{array}
$$

## Term Frequency

$$
\mathrm{tf}_{t, d}=\operatorname{count}(t, d)
$$

tf(admiral,Persuasion) $=69$
$\mathrm{tf}($ horse,Persuasion $)=15$

|  | Emma | Persuasion | Sense \& Sensibility |
| :---: | :---: | :---: | :---: |
| admiral | 0 | 69 | 0 |
| dance | 49 | 11 | 21 |
| admire | 31 | 14 | 18 |
| horse | 40 | 15 | 24 |

## Inverse Document Frequency

$$
\operatorname{idf}_{t}=\frac{N}{\operatorname{df}_{t}} \quad \begin{array}{ll}
\operatorname{idf}(\text { admiral })=\frac{3}{1} \\
\operatorname{idf}(\text { horse })=3 / 3
\end{array}
$$

|  | Emma | Persuasion | Sense \& Sensibility |
| :---: | :---: | :---: | :---: |
| admiral | 0 | 69 | 0 |
| dance | 49 | 11 | 21 |
| admire | 31 | 14 | 18 |
| horse | 40 | 15 | 24 |

## TF-IDF

$$
w_{t, d}=\mathrm{tf}_{t, d} \times \mathrm{idf}_{t}
$$

tf-idf(admiral, Persuasion) $=64 \times 3=\begin{gathered}180 \mathrm{flz} \\ 192\end{gathered}$ tf-idf(horse,Persuasion) $=15 \times 1=15$

|  | Emma | Persuasion | Sense \& Sensibility |
| :---: | :---: | :---: | :---: |
| admiral | 0 | 69 | 0 |
| dance | 49 | 11 | 21 |
| admire | 31 | 14 | 18 |
| horse | 40 | 15 | 24 |

## What is a document?

Could be a play or a Wikipedia article
But for the purposes of tf-idf, documents can be anything; we often call each paragraph a document!

## Vector <br> Semantics \& Embeddings

## Positive Pointwise Mutual Information (PPMI)

Pointwise Mutual Information

Do events $x$ and $y$ co-occur more than if they were independent?

$$
\operatorname{PMI}(x, y)=\log _{2}\left(\frac{P(x, y)}{P(x) p(y)} \text { as } \begin{array}{l}
\text { Different it } \\
\text { not corlitionaly } \\
\text { independent }
\end{array}\right.
$$

## Pointwise Mutual Information

Do events $x$ and $y$ co-occur more than if they were independent?

$$
\operatorname{PMI}(X, Y)=\log _{2} \frac{P(x, y)}{P(x) P(y)}
$$

## PMI between two words: (Church \& Hanks 1989)

Do words $x$ and $y$ co-occur more than if they were independent?

$$
\operatorname{PMI}\left(\text { word }_{1}, \text { word }_{2}\right)=\log _{2} \frac{P\left(\text { wood }_{1}, \text { word }_{2}\right)}{P\left(\text { wad }_{1}\right) P\left(\text { wad }_{2}\right)}
$$

## Positive Pointwise Mutual Information

- Issue: PMI ranges from $-\infty$ to $+\infty$
- What do negative values mean?
- Things are co-occurring less than we expect by chance
- Unreliable without enormous corpora
- Imagine w1 and w2 whose probability is each 10-6
- Hard to be sure $\mathrm{p}(\mathrm{w} 1, \mathrm{w} 2)$ is significantly different than 10-12

## Computing PPMI on a term-context matrix

Matrix F with W rows (words) and C columns (contexts)
$\mathrm{f}_{\mathrm{ij}}$ is \# of times $\mathrm{w}_{\mathrm{i}}$ occurs in context $\mathrm{c}_{\mathrm{j}}$

$$
p m i_{i j}=\log _{2} \frac{p_{i j}}{p_{i *} p_{i j}} \quad \text { ppmiij}=\left\{\begin{array}{cc}
p m m_{i j} & \text { if } p m m_{i j}>0 \\
0 & \text { otherwise }
\end{array}\right.
$$

|  | computer | data | result | pie | sugar | count(w) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| cherry | 2 | 8 | 9 | 442 | 25 | 486 |
| strawberry | 0 | 0 | 1 | 60 | 19 | 80 |
| digital | 1670 | 1683 | 85 | 5 | 4 | 3447 |
| information | 3325 | 3982 | 378 | 5 | 13 | 7703 |
|  |  |  |  |  |  |  |
| count(context) | 4997 | 5673 | 473 | 512 | 61 | 11716 |

## Computing PPMI on a term-context matrix

Matrix F with W rows (words) and C columns (contexts) $\mathrm{f}_{\mathrm{ij}}$ is \# of times $\mathrm{w}_{\mathrm{i}}$ occurs in context $\mathrm{c}_{\mathrm{j}}$
$p m i_{i j}=\log _{2} \frac{p_{i j}}{p_{i^{*}} p_{* j}}$

$$
p_{i j}=\frac{f_{i j}}{\sum_{i=1}^{W} \sum_{j=1}^{C} f_{i j}}
$$

$$
p_{i^{*}}=\frac{\sum_{j=1}^{c} f_{i j}}{\sum_{i=1}^{W} \sum_{j=1}^{C} f_{i j}}
$$

$$
p_{*_{j}}=\frac{\sum_{i=1}^{W} f_{i j}}{\sum_{i=1}^{W} \sum_{j=1}^{W} f_{i j}}
$$

## Weighting PMI

PMI is biased toward infrequent events

- Very rare words have very high PMI values

## Two solutions:

- Give rare words slightly higher probabilities
- Use add-one smoothing (which has a similar effect)
